Is strongly made with tubular frame and galvanized drum 9 inches in diameter. All joints are electrically welded. Capacity, 100 feet of ¾-inch garden hose. Wheels are 22 inches in diameter; handles 28 inches long; weight 15 pounds. Price each \$2.70

No. 2 All Metal Reel

A very popular garden hose reel made of metal throughout. Substantially built and will stand hard wear. Frame is tubular with corrugated drum and wire arms. Cast iron wheels 7 inches in diameter. Drum holds 100 feet of rubber garden hose. Shipping weight 12½ pounds. Price each \$2.00

Hardwood Reel

Oil finish. Holds 100 feet ¾-inch hose. Price each \$2.00

Hose Reels and Carts

Park and Warehouse Reels

A tubular iron reel with frame mounted on flat tired steel wheels. Is strongly built, compact and serviceable and will stand hard wear.

Nos. 21, 31 and 32 are suitable for Parks, Lawns, Greenhouses, etc. Nos. 41, 51 and 61 for Mills, Warehouses, Factories, Railroads, etc.

Knox Hose Carts

These carts are suitable for a large quantity of small hose or a small quantity of large hose. The reel, frame and tongue are of tubular steel. Wheels of steel with wide tires.

Nos. 101, 102 and 103 are very strong and finished in vermilion and black. They are especially adapted for Railroads, Mills, Factories and Warehouses.

Village Hose Carts

Highest quality material and workmanship. Of medium weight and will endure extremely rough usage. Mounted on the best pattern wood wheels. Tool box and friction roller at rear, rope reel and drag rope, nozzle holder on tongue and tongue rest. Equipped with fireman's axe and crow bar in spring holders. Hub caps are polished brass or nickel plated if desired. Handsomely finished in vermilion and black.

Our Sampson Mill Hose is strong and durable. For prices see index.

Sterling Chemical Fire Extinguisher

Approved and Labeled by the Underwriters Laboratories, Inc.

Statistics show that 90 per cent of all fires are discovered at their start and fire department reports show that 80 per cent are extinguished by chemical apparatus.

With this extinguisher a stream can be thrown 50 feet on to walls, floors, into shelving and other places. This stream carries a large amount of carbonic acid gas, which excludes oxygen, preventing further combustion. It will put out burning oil, naphtha and gasoline, which plain water only spreads.

It is handsomely finished in polished copper, well lacquered to prevent tarnishing. The cylinder is built to withstand enormous pressure and lined with lead. At the top of the cylinder is a cage which holds a bottle containing sulphuric acid, covered by a loose lead stopper. The cylinder is nearly filled with water, into which one and one-half pounds of bicarbonate of soda has been dissolved.

To operate the extinguisher, invert the cylinder and play stream at the fire. Inverting the cylinder allows the lead stopper to fall out of the bottle and the acid feeding slowly into the soda solution, instantly creates a large volume of carbonic acid gas which is forced out through the hose by the pressure generated. This dense vapor, which is thrown fifty feet literally smothers the fire. A 3-gallon extinguisher will put out more fire and in less time than 120 gallons of water.

Extra charges are inexpensive and may be purchased from us or any drug store. Extinguishers should be tested about once a year if inactive.

Chemical extinguishers are highly recommended by all fire insurance companies, and the Sterling bears the label of the Underwriters Laboratories, Inc., which is their mark of approval.

Capacity 3 gallons; weight empty 19 pounds; charged 50 pounds.

Price complete with charge.....\$15.00

Champion Fire Tube

Equal to the best dry powder fire extinguisher on the market. Made of heavy tin, enameled red, with directions in white relief. Tube fitted with detachable cover which is easily removed by a sharp jerk.

Size is 2 inches in diameter, 22 inches long and contains 3 pounds of compound.

The compound used is the result of many years' experiment. The chemicals are of the best grade and mixed in the proper proportions. (Positively no sand used in the Champion Fire Tube.)

The tube is hung on a nail or hook, and, when required for use, a jerk removes the cover and permits the operator to throw the contents on the fire.

The Champion Fire Tube is guaranteed to be equal to the best and superior to many fire tubes now on the market, and the price is only.....\$1.00

Sterling Chemical Fire Extinguisher

Champion Fire Tube

Fire Department Pump Extinguisher

Recommended and used by the Chicago Fire Department. Very efficient for putting out small fires. Especially adapted for public buildings, schools, etc. Only plain water is used, which is preferred by some to the chemical extinguishers.

Cylinder is 16½ inches high, has a capacity of 5 gallons and equipped with a double-acting brass pump, forcing a stream through hose on both up and down strokes. Painted red.

Price, Copper.....\$17.00

Price, Galvanized Iron.....\$8.50

"Arctic" Non-Freezing Fire Extinguisher

The chief objection to hand extinguishers of the ordinary type has been that the contents freeze at slightly below the freezing point of water, in which condition the extinguisher is useless. The "Arctic" is unlike any other extinguisher made. It is charged with calcium chloride which will not freeze at 30 to 40 degrees below zero. The expelling force is three ounces of carbonic acid gas contained in a steel bottle at the top of cylinder.

The "Arctic" is especially adapted for use by railroads, docks, ferries, warehouses, cold storage plants, and all other places not heated uniformly through the winter and where extinguisher must be protected from frost. Furnished in polished copper, red Japan or nickel plate, capacity 3 gals. Price.....\$25.00

Forty Gallon Factory Chemical Engine

Designed for indoor use generally in factories, warehouses, etc., but also adapted to fire-yard duty. Its high wheels and light, yet strong construction, make it easy for one man to handle. No experience is required to operate it; turn over cylinder which is balanced on the wheels, open valve and it is ready for service. Hose is folded on rack in a figure eight, preventing it from kinking when taken off for use.

Tank: Capacity 40 gallons. Seamless high pressure steel drawn cold and pressed into shape; double lead coated. Tested to three times required strength. Brass shut-off valve to hose connection. All fittings are of brass highly polished.

Acid Bottle: One of pure lead in brass case, handle on top.

Soda Bag: One of heavy canvas.

Hose: Fifty feet of 3/4-inch 4-ply extra quality, brass couplings attached.

Nozzle: One brass shut-off, nickel plated.

Hose Bracket: Four steel arms.

Painting: English vermilion on wheels and frame. Aluminum on tank, striped with gold.

Wheels: Sarven "A" grade, 48-inch high, steel tires.

Axles: Special concord steel, with solid collar.

Handle Bar: Forged steel.

Equipment: All necessary wrenches and spanners are furnished.

Dimensions: Height, 51 inches; width, 29 inches.

Weight: 400 pounds.

Can also be furnished equipped with copper tank, roller bearing axles and rubber tired wheels.

Forty Gallon Department Chemical Engine

This engine is built to meet all the requirements of a Volunteer Fire Department. Its high wheels and well balanced construction make it very easy running, well adapted to cover a large territory. Operation is effected in the same way as the Factory Engine, i. e., by turning over tank and opening valve. No modern feature has been omitted, and we fully guarantee to give efficient fire service.

Tank: Capacity, 40 gallons. High pressure steel, cold drawn, double lead coated, equipped with pop safety valve and brass trunnions, which rest on brass journal boxes on frame, brass tipping wheel, shut-off valve and brass pressure gauge.

Acid Bottle: One of pure lead in brass case. Non-slopping type.

Soda Bags: Two of heavy canvas.

Funnels: Two, one galvanized and one copper tinned.

Hose: One hundred feet 3/4-inch, 4-ply extra quality chemical engine hose, in one section, with brass coupling attached.

Hose Basket: Iron, with tubular top rim allowing hose to pull out freely.

Charge Holders: Two, one on each side of frame.

Axe and Crow Bar:

One of each held to side of frame in spring holders.

Lanterns: Two nickel-plated, in spring holders.

Wheels: Sarven "A" grade, 56 inches high, with polished brass closed end hub caps, steel tired.

Axles: Special Concord steel, with solid collars.

Frame: Forged steel, with steel tongue, handle bar, hand grabs and folding tongue rest.

Rope Reel: With flanges and ratchet attached to front of frame and fifty feet of good manila rope.

Equipment: Hard wood tool box, all necessary spanners and wrenches.

Dimensions: Tread, 48 inches; width, 51 inches; height, 57 inches; length, 11 feet.

Weight, empty, 500 pounds; loaded, 825 pounds.

Prices of Chemical Engines Quoted on Application.

Fire Department Equipment

We are prepared to furnish fire department equipment of all kinds, such as chemical apparatus, ladders and ladder trucks, fire bells and steel towers, etc. Fire hose and brass hose goods, such as couplings, expanders, play pipes, etc., and fire axes, lanterns, fire buckets will be found on other pages of this catalog; consult index. Quotations on equipment of all kinds gladly furnished upon application.

"Red Raven" Red Sheet Packing

Red Raven Red Sheet Packing is made of a soft and tenacious compound which resists the action of heat, retains a high degree of pliability in the hottest joints and will not blow out under the highest pressure. It is fully equal to similar highly advertised packings and is so guaranteed by us.

Red Raven will make a cold or hot water, steam or air joint, equally well and is not affected by oils, steam, alkalis or liquors. Being absolutely uniform in thickness and not affected by ammonia, it can be safely used in packing ammonia joints in ice and cold storage plants and is particularly adapted for this work.

Red Raven is carried in stock in rolls 36 inches wide. We do not cut rolls lengthwise but will furnish any quantity 1 yard wide. Sizes $\frac{1}{8}$, $\frac{1}{4}$ and $\frac{1}{2}$ -inch. Approximate weights, 2 $\frac{1}{4}$, 5 $\frac{1}{2}$ and 11 lbs. per sq. yd.

Full rolls, per pound.....

Cut pieces, per pound.....

\$1.00

\$1.10

"Rainbow" Red Sheet Packing

A highly advertised red sheet packing preferred by some. Sizes and weights same as Red Raven Red Sheet Packing.

Per pound.....\$1.20

With wire insertion, per pound.....\$1.50

"Jenkins' 96" Sheet Packing

Jenkins' 96 is an unvulcanized sheet packing well known to the steam engineering trade for many years. Will stand high temperatures and pressures successfully. Sizes and weights same as Red Raven Sheet Packing.

Per pound.....\$2.00

"Hippo" Black Oilproof Sheet Packing

In our "Hippo" Black Oilproof Sheet Packing will be found all the characteristics which make a perfect rubber sheet packing. It can be used for packing all kinds of joints in connection with oil, gas, acids, steam, ammonia, and hot or cold water and will not crack, char or blow out under steam or other pressures. Can be used repeatedly until entirely worn out. Furnished in rolls or cut pieces 36 inches wide. Sizes and weights same as Red Raven.

Per pound.....\$1.00

Durabla Sheet Packing

Durabla compressed asbestos fibre gasket. Will hold wet as a steam equally as well as superheated steam and high pressure, is not affected by 800 degrees F. or 300 pounds steam pressure. Is oilproof and gives perfect service on ammonia, gas or compressed air. $\frac{1}{8}$ -inch thick and sheets measure 36 by 108 inches, 48 by 120 inches, 48 by 58 inches.

Price, per pound.....\$2.00

Cloth Insertion Sheet Packing

Cloth Insertion Sheet Packing is made of alternate layers of rubber and duck, one ply of duck in every 16th-inch of thickness. Intended for packing water pipe and low pressure joints. Furnished cloth insertion, cloth one side or cloth both sides, and in three grades. Rolls or cut pieces 36 inches wide in sizes $\frac{1}{8}$ and $\frac{1}{4}$ -inch. Approximate

weights, 6 $\frac{1}{2}$ and 12 $\frac{1}{2}$ pounds per square yard.

"S" grade, per pound.....\$0.32

"Q" grade, per pound......28

"M" grade, per pound......24

"Autoline" Gas Engine Sheet Packing Asbestos Wire Insertion

Made especially for gasoline engines, being unaffected by the extreme heat coincident with this service. Surfaced with a high heat resisting compound, red on one side and black on the other. This is an excellent packing and may be used with any degree of pressure or heat. Rolls 39 inches wide. Sizes $\frac{1}{8}$ and $\frac{1}{4}$ -inch. Weights 3 $\frac{1}{4}$ and 5 $\frac{1}{4}$ pounds.

Per pound.....\$2.00

"Tenax" Compressed Asbestos Packing

A perfect packing for low or high pressure steam, superheat steam, gas engines, etc. Will stand temperature of 1600 degrees F. and 600 pounds pressure. Carried in sheets 48 inches square, in sizes $\frac{1}{8}$ to $\frac{1}{2}$ by 32nds. Weights, 2 to 16 pounds per sheet.

Per pound.....\$2.00

"Endura" Fibre Sheet Packing

"Endura" for packing hot or cold water, crude oil, gasoline, etc. Contains no rubber or asbestos. Will not rot or soften. Sizes $\frac{1}{8}$ and $\frac{1}{4}$ in rolls 37 inches wide, $\frac{1}{8}$ and $\frac{1}{4}$ in sheets 36 inches square. Weights $\frac{1}{4}$ to 6 pounds per square yard.

Per pound.....\$2.00

Red Raven Packing is the equal of any red sheet packing made.

Keystone Red Tubular Gaskets

For Manholes and Handholes. Made from the well-known "Red Raven" Compound

Keystone Red Tubular Gaskets are made of our well-known "Red Raven" Compound, a stock unexcelled for universal packing. They conform to all irregularities of the faces in the meeting surfaces and will not crack nor harden under the highest temperatures. They will not blow out under steam pressure. Gaskets of any size or form are readily made by cutting pieces the correct length to go around the flange, joining the ends together with a small metal tube and wrapping with adhesive tape, all of which are supplied with each box of gaskets.

These gaskets are essentially for general service and with a box of each size on hand, an engineer can pack any joint perfectly and without waste of time or material, as the **shortest pieces can be quickly formed into perfect gaskets** by utilizing the metal tubes and tapes furnished.

Made in the following sizes, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$ and $\frac{1}{4}$ -inch, and in lengths from 12 to 36 feet, according to the diameter. Put up in boxes weighing from 7 to 10 pounds each.

Price per pound.....\$1.30

Hydraulic Packing

Square

Cross Section

In Ring Form

For hot water service, our Sterling extra fine, hard, white friction and fine white duck will give entirely satisfactory service. Most square duck packings swell abnormally under these conditions; in a test our packing was boiled for ten hours and examination showed it had swollen but little. We have never found another duck packing which equals it and we highly recommend and guarantee it. Sizes $\frac{1}{4}$ to 1-inch square. In flat coils, packed in boxes weighing 5 to 10 lbs. Price per lb. **\$1.50**

Also supplied in ring form for water piston heads of steam pumps, plungers, etc., and being cut to exact measurements it is easily and quickly put in the pump and is superior to any other form of hydraulic packing, as it has no joints. Particularly adapted for pumps handling very hot water and under high pressure. When ordering ring packing, specify inside and outside diameter and thickness required.

For cold water service our No. 1 grade will give entire satisfaction. Made of white duck and black friction. Sizes $\frac{1}{4}$ to 1-inch square. In flat coils packed in box weighing from 5 to 10 lbs. Price per lb. **\$0.60**

Illustration shows cross section of both hot and cold water packing. When ordering be sure to specify which is wanted.

Folded Asbestos Gaskets

For manholes, handholes and flange joints. These gaskets will stand practically any working pressure and temperature of steam. They are folded by hand and made of a fine quality asbestos sheeting interwoven with a bronze wire mesh and the entire gasket is coated with a white rubber heat resisting compound. They have no raw edges. They may be re-used many times when taken out and replaced carefully. In some places they have been in use for over a year without being renewed. In ordering always give exact inside dimensions and width of flange, as there is no standard size. Failure to comply with this request will cause delay and correspondence.

Handhole sizes, per lb. **\$2.70**
Manhole sizes, per lb. **2.50**

Square Flax Packing

Sterling Flax Packing is made of pure extra long fibre flax entirely free from hemp. It is waterproof, steam proof and frictionless and will not char or burn. It is thoroughly lubricated with materials carefully selected for their efficiency, and is very soft and pliable, a quality that will be appreciated by users of flax packing. Put up in boxes of 6 to 8 pounds, in sizes $\frac{1}{4}$ to 2-inch, advancing by 8ths; also on 50, 100 and 200 lb. reels. Per lb. **\$1.00**

No. 1 Flax Packing differs from our Sterling grade in being made of shorter fibre flax but does not contain any hemp or gritty substances. It is thoroughly lubricated and where a strictly first quality is not required it will give entire satisfaction. Packed in flat coils in boxes weighing from 6 to 8 lbs., in sizes from $\frac{1}{4}$ to 2 inches, advancing by 8ths; also put up on reels. Larger sizes made to order. Per lb. **\$0.60**

Rubber Cloth Insertion Gaskets

These gaskets are made from high grade cloth insertion rubber sheet packing and are used for water or low pressure steam service in manholes and handholes.

All regular sizes are carried in stock and can be shipped immediately. Sizes up to 7x9 inches have 1-inch flange and are $\frac{3}{8}$ inch thick; larger sizes have $1\frac{1}{4}$ -inch flange and are $\frac{1}{4}$ inch thick. In ordering special sizes always give width of flange and thickness, otherwise standard sizes will be furnished.

Gaskets of any size and shape can be made to order promptly. Always send sketch showing measurements or full size pattern when ordering.

Sizes 7x9 inches and smaller, per lb., **\$1.20** Larger sizes, per lb. **\$1.10**

Steamfitters can rely on the quality of the goods shown in this catalog.

"Keystone" Piston Rod Packing

Keystone packing will pack piston rods absolutely tight without binding, and because of its durability is highly economical. Made in two styles, Regular and Special, and in three forms, sectional ring, expansion ring and spiral.

Regular is for use in steam or hydraulic service where the pressure and temperature is not excessive and Special for high steam pressures, superheat steam, high speed engines and all unusual or hard conditions.

Sectional ring form is cut in wedges and used where rods are out of center, or are cut and scored, in deep stuffing boxes and other places hard to keep tight. Made to order only. Give exact measurements of stuffing box.

Regular, per lb. \$2.50 Special, per lb. \$3.00

Expansion ring form is preferred by many as it is made to exact size of stuffing box and a perfect fit assured. Give exact measurements of stuffing box.

Regular, per lb. \$2.00 Special, per lb. \$2.50

In spiral form, packing can be cut to fit any size rod. Packed in 12-foot coils in dust-proof boxes. Following is the approximate weight per box:

Size, inches	$\frac{1}{4}$	$\frac{3}{8}$	$\frac{1}{2}$	$\frac{5}{8}$	$\frac{3}{4}$	$\frac{7}{8}$	1	1 $\frac{1}{4}$	1 $\frac{1}{2}$	1 $\frac{3}{4}$
Weight, pounds	1	1 $\frac{1}{2}$	1 $\frac{1}{2}$	1 $\frac{3}{4}$	2 $\frac{1}{2}$	3	3 $\frac{1}{4}$	5 $\frac{1}{4}$	6 $\frac{3}{4}$	8
Regular, sizes $\frac{1}{4}$ to 1 $\frac{1}{2}$ -inch.	Per pound									\$1.50
Special, sizes $\frac{1}{4}$ to 1 $\frac{1}{2}$ -inch.	Per pound									\$3.00

Expansion Ring

Sectional Ring

Non X-L Spiral Piston Rod Packing

Non X L spiral packing is especially desirable for high speed engines, rods working in oil, oil pumps, valve stems of Corliss engines, etc., at medium pressures. It is elastic, frictionless and durable. The core is made from our Red Raven Compound, around which is closely rolled a special duck well frictioned together and thoroughly lubricated on the outside.

Packed in dust-proof boxes containing 12 feet in sizes $\frac{1}{4}$ to 1 $\frac{1}{2}$ inches, advancing by 16ths. Weighs a trifle less per box than Keystone spiral packing.

Per pound \$1.50

Channon's Waterproof Hydraulic Packing

This packing will not clog, corrode or gum machinery, nor scatter or dissolve by action of the water. It will outwear ordinary flax packing, being specially prepared for hydraulic service. Core is our Red Raven compound surrounded with thoroughly lubricated flax of the finest quality. Packed in dust-proof boxes containing 12 feet. Sizes $\frac{1}{4}$ to 1 inch by 8ths.

Price per pound \$2.00

Channon's Gum Core Packing

Intended for low pressure work and especially suitable for old style engines with badly worn rods or disarranged stuffing boxes, as it stands excessive gland pressure. Furnished either round or oval. Special rubber core covered with braided flax saturated with the finest lubricants obtainable for the purpose. Packed in boxes weighing 5 to 10 pounds. Sizes $\frac{1}{4}$ to 1 $\frac{1}{2}$ inches by 8ths.

Price per pound \$0.75

Dollar Junior Packing

Made of finest imported flax duck walls and purest rubber back. Stands 150 pounds of steam without hardening. For steam or air rods, pump plungers, steam hammers, rams, etc.

Price per pound \$1.50

Mabb's Hydraulic Rawhide Packing

Made of the best mechanical rawhide which is extremely tough and will outlast the best vegetable fibre many times over. It is purely glutenous, self-

lubricating and anti-friction.

Never requires entire renewal. Simply add a fresh layer on top as needed. Contains nothing to wear or injure rods, cylinder or plunger.

Furnished in packages of 5, 10, 25, 50 or 100 feet, or in lengths cut to order. Price per pound \$2.00

Metalbestos High Pressure Packing

Has a core of rubber-bestos compound covered with a series of braids of finely spun asbestos thoroughly lubricated, outside of which is a covering of soft metallic wire. Will not burn, char or blow out under any pressure. Packed in boxes weighing 5 to 10 pounds. Sizes $\frac{1}{4}$ to 1 $\frac{1}{2}$ inches.

Price per pound \$2.50

Fine Rubber Pump Valves

We are in a position to furnish any kind of valves required and for any particular service. When ordering it is necessary for us to know the diameter and thickness of the valve and the size of hole through it. Be sure to make all measurements exact. Also state what kind of liquid it will be used in conjunction with, and whether it will be hot or cold.

We have two grades, Sterling extra quality high pressure valves and No. 1, regular quality.

Sterling valves can be used for the same purpose that No. 1 quality will answer for, and as they are made of a much higher quality compound, will give double the service and prove more satisfactory in every way. No. 1 quality valves are always furnished unless sterling quality is specified.

Soft Valves

For use in cold water only. They are soft with perfectly smooth surface. Use Sterling quality for pressures over 50 pounds.

Sterling quality, per pound..... \$1.50
No. 1 quality, per pound..... 1.20

Hard Valves

These valves are made to stand very high temperature. Being compounded both hard and tough, will last a long time and stand great pressure.

Sterling quality, per pound..... \$2.00
No. 1 quality, per pound..... 1.70

Medium Hard Valves

For semi-hot water. Very durable and can be used where considerable pressure exists.

Sterling quality, per pound..... \$1.50
No. 1 quality, per pound..... 1.40

Condenser Valves

Condenser valves are made especially for marine work. They are very soft and red in color.

Sterling quality, per pound..... \$6.00
No. 1 quality, per pound..... 3.00

Prices are for each valve.

Perforated Rubber Mats

Perforated rubber mats possess desirable features not found in any other floor coverings, being non-slip, attractive, durable, sanitary, economical and prevent slipping. Initials, names or numbers can be inlaid at slight additional expense. It is best that large mats be made in sections, avoiding liability of tearing when being moved. Perforations like design shown or special ones can be furnished. Designs with round or nearly round perforations are better than those with sharp corners, lessening the chance of tearing.

Rubber Matting

several other patterns. Prices on application.

Weights approximately as follows: 1/4, 6 lbs.; 3/8, 8½ lbs.; 1/2, 13½ lbs.; 3/4, 18½ lbs. per sq. yard.

Price per pound, corrugated as shown..... \$0.40

We can furnish

Rubber Pump Diaphragms

Being large manufacturers of diaphragm pumps necessitate our furnishing diaphragms which give reliable service. There are many cheaper ones offered, but they do not give the long satisfactory service as ours, which are made of tough durable rubber to withstand severe service. Loud and Channon diaphragms are the same, but the Edison are different. Be sure to state which is wanted, otherwise Channon diaphragms will be furnished.

Number..... 1 2 3 4
Channon's or Loud's..... \$3.00 \$4.00 \$6.00
Edison..... 3.50 5.00 \$7.00

Rubber Mallets

Used in foundries, furniture and other wood working shops, garages and other industrial lines for hammering materials which would be injured by the use of a metal hammer. Our mallets are made of an excellent grade of rubber compound of correct hardness. Each mallet is furnished complete with handle as shown.

Number..... 0 1 2 3 4
Price ea. \$0.90 \$1.20 \$1.30 \$1.50 \$2.00

Special Moulded Rubber Goods

We are fully equipped to produce all kinds of rubber compounds, formed out or molded into special shapes. When inquiring about material of this nature it is requested that a sketch be sent, when possible, together with full description of the uses for which it is intended.

Rubber Sheave Filling

Twenty-one shapes are carried in stock. When ordering it is best to send a small sample showing exact size and shape wanted. Per pound..... \$1.25

Pump Leathers

In ordering always state diameter of cylinder. Packed in cartons containing 1 dozen leathers.

Diam. Cyl., Inches	Diam. Valve, Inches	Per Dozen	Price Each
3	2½	\$0.65	\$0.07
2½	2½	.80	.08
2½	3	.85	.09
2½	3½	1.00	.10

Large sizes on application.

We can furnish Pump Valves for work in any service.

Asbestos Wick and Rope Packing

Asbestos Wick

Asbestos Rope

Our asbestos wick packing is composed of the purest asbestos fibre strands, twisted into the form of a round lamp wick about $\frac{1}{4}$ inch in diameter. It is absolutely acid and fire proof. Used for packing valve stems, small steam pumps, etc. In balls of $\frac{1}{4}$, $\frac{1}{2}$ and 1 pound.

Price per pound.....\$1.75

Asbestos rope packing is made of firmly spun asbestos fibre tightly twisted into rope of any size from $\frac{1}{2}$ to 2 inches and put up on reels weighing from 10 to 25 pounds. Especially adapted for superheat steam.

Price per pound.....\$1.75

Palmetto Twisted Valve Stem Packing

A well known packing for globe valves, blow-off cocks, injectors or wherever a small size packing is needed that will not harden. Each strand carries its own lubricant and by unstranding any size valve can be packed from one spool.

Carried in sizes $\frac{1}{8}$, $\frac{3}{16}$, $\frac{1}{4}$ and $\frac{5}{16}$ inches.

Price per pound.....\$2.50

Lead Rope

For making metallic packing. For stuffing boxes and valve stems, the lead rope should be freely saturated with graphite and oil; for making gaskets it is enclosed in cheese cloth. For steam packing it may be rolled in cheese cloth, and thoroughly saturated with graphite and oil.

Price per pound.....\$2.50

Cotton Candle Wick

Our extra quality is spun into very fine yarns from pure white cotton. It will burn with a minimum of smoke.

Grade	Bale Lots, per Lb.	5-Lb. Sacks, per Lb.	Lesser Quantities, per Lb.
No. 1	\$0.36	\$0.40	\$0.50
Extra	.66	.70	.80

Palmetto Braided Packing

For all steam and compressed air pressures, especially high pressure super-heated steam. Each strand is a reservoir of lubricant and does not harden in service. Furnished in sizes from $\frac{1}{4}$ to 2 inches in 5-pound boxes.

Price per pound.....\$2.50

Channon's Three-Piece Diagonal Rod Packing

A most durable and economical rod packing. Constructed with two diagonal wedges and a cushion, encased in a cover of finely braided linen, thoroughly lubricated and wrapped with muslin to keep out all dirt and grit. Its peculiar construction makes it a compensating packing, providing for all inequalities of rod or stuffing box and packing absolutely tight without friction. It is very durable and outlasts most other rod packing.

Made in two styles, Regular for pressures up to 100 pounds and Special for all higher pressures up to 250 pounds. Packed in flat coils in boxes weighing 6 to 8 pounds. Sizes $\frac{1}{2}$ to 3 inches high.

Regular, per pound.....\$1.50

Special, per pound.....2.50

Daniels' P. P. P. Packing

The same in construction as Channon's three piece diagonal packing. When ordering P. P. P. always state if for ammonia rods as packing is especially prepared for that purpose. Regular and Special P. P. P. are made in $\frac{1}{4}$ -inch sizes from $\frac{3}{16}$ to $1\frac{1}{4}$ inches, and from $1\frac{1}{4}$ inches, advancing by $\frac{1}{8}$ inches up to 3 inches. Regular P. P. P. is for steam pressures of 100 pounds or less; ordinary water pressures (cold or warm), low ammonia pressures, valve stems, etc. Special P. P. P. for steam pressures over 100 pounds (when not superheated), high ammonia pressures, high hydraulics, etc.

Regular. Price per pound.....\$2.00

Special. Price per pound.....2.50

Pilley's Packing Tools

No. 4. Set of 4 tools, 8, 10, 12, 14 inches long. Per set.....\$1.50

No. 6. Set of 6 tools, 6, 8, 10, 12, 14, 18 inches long. Per set.....2.25

Hemp Packing

Carried in 50 and 100 pound coils in the following grades:

	Price per pound
Italian A.....	\$0.50
American B.....	.40
Plumbago and tallow laid.....	.45

Jute Gasket Packing

For calking water mains, etc. Packed in 75-pound coils. Price per pound.....\$0.14

Steel and Brass Oilers

These oilers are very suitable for machinists, engineers and for tool equipments. Made from 20 gauge stock, clock steel, spring bottom, heavily copper plated. Spout connections have large filler openings $1\frac{1}{2}$ inches in diameter and are turned from solid brass.

Packed 1 dozen in a pasteboard box.

Wall's Brazen Steel Bench Oiler

Used by machinists, steam fitters, etc., and is recognized as the most efficient oiler on the market. It is practically indestructible, heavily brazen throughout with hard spelter. Spout is steel, case-hardened at the point, and has large opening at body. Bottom is spring steel brazed to steel body. Spout and body are polished.

No.	Price per Dozen	Price Each	Capacity, Pints	Diameter, Body, Ins.	Length Spout, Ins.	Extra Spouts

*111	20.00	2.00	.90	5	8	10 or 14	4

*The spouts on these sizes are extra large, measuring 1 1/2 inches at base.

Howland Pump Oilers

Especially designed for machinery oiling, such as overhead bearings and all places not easily reached with a common oiler. Pump mechanism, being always in oil, never loses its priming, while lo-

cation of plunger is most convenient, being directly under thumb, working with a downward pressure. Has union spout connection, which enables spout to be adjusted to any position.

Capacity, Pints	No.	Tin Each	Diam. of Body, Inches	Length of Spout, Inches

Gasoline and Oil are cheaper if bought in large quantities. Use "Channon's Steel Barrels".

Drawn Metal Compression Grease Cups

Grease cups drawn from rolled sheet metal are superior in many respects to the ordinary cup made from castings. They are lighter and better than cast cups of the same capacity, there being no excess weight of metal where it is not needed; at the same time drawn cups are very strong and rigid. The metal is dense and uniform, breakage and leakage due to spongy metal and sand holes are unknown and breakage of the threaded shank is eliminated. We offer a full and complete line.

Plain Grease Cups, Steel or Brass

Lunkenheimer Compression Grease Cups

Tiger

Primo

The Tiger grease cup is cast brass, heavy and substantial being provided with spring lock and leather washer, making it well adapted for jarring machinery. The Primo is an all steel cup provided with spring and ratchet as shown in illustration.

Miscellaneous Glass Body Engine and Machine Oilers

Glass Body Oil Cups

Type A

Type B

Type C

These oil cups are all made with metal parts of cast (not pressed or spun) brass, with highly polished finish. They are correctly designed, strong and substantially constructed, and simple in operation. Type A Snap lever sight feed. Type B Plain with sight feed. Type C Plain with blind feed.

When ordering, always state which type is wanted, otherwise Type A will be furnished.

Powell Glass Body Oil Cups

Pilgrim

The Signal oiler is one of the best known of its type on the market. When it is desired to shut off the oil it is only necessary to turn down the snap lever. This does not interfere with the adjustment, and when snap lever is again turned up the flow of oil is resumed.

When the Pilgrim is used it is necessary to reset the feed each time the oil has been shut off.

"Safety" Crank Pin Plunger Oiler

With Double Feed and Automatic Shut-off.

This cup has two feeds, a positive force feed from bottom of cup and a splash feed from top through the hollow plunger. Cup does not require shutting off when engine is stopped, as the plunger seats at bottom of cup and oil will not feed when engine is not running. Stroke of plunger is adjustable.

Gas Engine and Air Compressor Lubricators

Standard Sight Feed Lubricator

For Gas and Gasoline Engines and Air Compressors.

This type of lubricator is intended for use on large gas engines and other places where a strong, substantial oil is required.

The feed regulation is obtained by a snap lever device which also starts and stops the flow of oil without changing the feed. The pressure is regulated by the valve in the shank.

Illustration shows lubricator with gauge glass, but the $\frac{1}{4}$ pint and $\frac{3}{8}$ pint are furnished with sight feed only.

Capacity, pints.....	$\frac{3}{4}$	$\frac{1}{2}$	$\frac{3}{8}$	$\frac{1}{4}$	$\frac{2}{8}$

Price, each.....	\$7.30	\$7.60	\$8.20	\$11.00	\$15.40

Bull's Eye Sight Feed Lubricator

This lubricator is neat in design, strongly made of the best steam metal and highly polished. It is extremely simple in construction and is therefore easy to operate and keep in repair. Its action is positive and the rate of feed is under perfect control at all times. The filler opening is large and by closing lower valve, lubricator can be filled while engine or air compressor is running. The sight feed glasses can be easily replaced.

Price, per pair.....	\$0.50

Glass Body Gas Engine Lubricator

The special feature of this lubricator is the pressure equalizer. This is a drilled passage leading from the base of the oiler to the area above the oil. It will be noticed from the sectional view that the equalizer is not a separate tube soldered on to the bottom of the cup, which may be shaken off by vibration or become bent.

Attention is also called to the improved filler hole which is larger than usual and makes filling easy.

The metal parts are made from the best brass (cast) and are highly polished.

Mechanical Force Feed Lubricators

The Hanson Force Feed Lubricator

Simple in construction and positive in action. Adapted for hard, rough service and outdoor work. Weather conditions do not affect its action and it will feed any kind of oil. Operated from any moving part of engine (valve motion usually the most convenient). Entirely automatic; starts and stops with engine and requires no attention except to refill oil reservoir. When reservoir is emptied, lubricator is disconnected and alarm bell rings. Body is made of brass. Gears and ratchet are accurately cut insuring smoothness

of operation and durability. All parts are interchangeable. Oil capacity $1\frac{1}{2}$ pints.

Price each, complete..... \$19.00

Manzel Force Feed Lubricators

Supplies oil regularly and positively in harmony with speed of engine. Feed is constantly in sight and is easily and accurately adjusted, each feed being regulated separately. Not affected by temperature. Glass reservoir is extra heavy and oil in it is always visible. Sight feed glass is not under pressure. All metal parts are heavy brass and nickel plated. Furnished with ratchet mechanism on right or left side.

Madison-Kipp Force Feed Lubricator

Model 50. Valveless, Sight Feed

For steam or gas engines, excavating machinery, air compressors, steam drop hammers, steam pumps, traction engines, grain separators, etc.

The new Model 50 is designed to meet every demand. It has no valves and will force oil in any temperature and against any pressure up to 2,000 pounds.

The tank is made of sheet steel, dirt and waterproof. All working parts are inside tank and work in oil. Oil gauge glass shows the amount of oil in tank at all times.

Oil gauge glass shows the

We can furnish Mechanical Force Feed Lubricators to meet any conditions.

Nugent's Patented Oil Filter With or Without Automatic Water Separator

The primary object of the Nugent oil filter is to provide the best known filtering elements which are convenient, simple, effective, interchangeable, get-at-able, and removable without interfering with its continuous operation or with a single pipe, fitting, bolt or valve. Simply open a door and turn on the electric light.

There are no mysterious passages for the oil to travel through. There are no partitions to complicate the cleaning operation. Wool, waste, excelsior, bone black, charcoal or felts cannot stop up the needle point sight feed valves and oil cups.

We don't claim to refine the oil and make it better than new. We guarantee to take out that which has gotten into it, viz.: dirt, grit and water. By so doing the oil is saved and cleaned and may be used over and over again, effecting a saving of fully 80%.

Removing the Filtering Bags for Washing

This operation does not interfere with the filtration process or a single pipe connection. Simply open the door, turn on the electric light and swing around the dirty set of bags which will stop automatically in front of the door and directly below the blank drip. It is not necessary to remove the bag from its respective ring for washing or cleaning. Wash bags in gasoline, benzine, kerosene or hot water.

No. 0 filter is cylindrical the total height.

Nos. 1, 2, 3 filters are rectangular like cut.

Nos. 4, 5, 6 filters have cylindrical top and rectangular base.

No.	Without Automatic Water Separator	With Automatic Water Separator	Filtering Capacity, Gallons per 24 Hours
0	\$ 46.00	\$ 56.00	96

6	620.00	570.00	1000

Larger sizes quoted upon application.

Oil Filters

For Filtering All Grades of Lubricating Oils

Cross Oil Filter

We recommend this style filter for filtering engine and common machinery oils.

The No. 2 size can be used with economy in connection with steam engines as small as thirty horsepower, or with gas and gasoline engines as small as twenty horsepower.

For garage use, this filter will reclaim all the wasted high priced lubricating oils which are drained from automobiles.

Made of extra heavy, galvanized iron, all joints soldered, lapped and riveted;

neatly painted, polished brass fittings and bosses, and nickel plated rim.

Cross "Style B" Oil Filter

This filter is guaranteed to separate water automatically from waste oil and at the same time to clean the oil so that it can be used over and over again. It will also take the condensed water and oil from oil separators and exhaust heads and successfully separate the cylinder oil from the water and filter the oil perfectly. This reclaimed oil will make an excellent lubricant for pumps and other machinery, but would not recommend it for re-use in the cylinder of an engine.

In ordering the Style "B," it is advisable to state the exact requirements and conditions under which the filter is to be operated.

No.	Capacity per Day of 24 Hours, Gallons	Price Each
1	20 to 30	\$ 59.00
2	5 to 10	39.00
3	40 to 50	120.00
4	50 to 60	150.00
5	70 to 90	180.00
6	100 to 120	220.00

No.	Capacity per Day of 24 Hours, Gallons	Price Each
1	20 to 30	\$ 80.00
2	5 to 10	50.00
3	40 to 50	140.00
4	50 to 60	180.00
5	70 to 90	220.00
6	100 to 120	260.00

For larger size filters than above we recommend the Burt unit type.

American Oil Filter.—Recommended for cleaning lard, cylinder crank-case and other grades of heavy oils. It is the ideal filter for use with gas or steam engines. This filter can also be equipped to reclaim dirty gasoline without extra charge. Prices on "American" are same as "Cross."

Write for special descriptive catalog.

Detroit and Michigan Lubricators

We carry in stock for immediate shipment both "Michigan" and "Detroit" steam lubricators. They are exactly the same in construction and are interchangeable, repair parts for Michigan Lubricators fitting Detroit Lubricators of the same pattern and vice versa. In ordering state distinctly whether Detroit or Michigan Lubricators are wanted, otherwise we will use our own judgment.

Repair parts for all of these lubricators can be furnished promptly.

Detroit "Improved Standard" and Michigan "Cyclone"

Sight Feed Lubricators—Double Connection

This type of lubricator is for use on all kinds of reciprocating steam engines, steam pumps, etc., and is intended for general service. The heating channel which passes through the body from the support arm to the upper sight feed arm is filled with steam at all times the lubricator is in operation, so that the oil is maintained at an even temperature and there is no fluctuation in the rate of feed. The heat keeps the oil in a thoroughly liquid condition and the lubricators will, therefore, feed the heaviest oil freely and regularly even in the coldest weather. The lower sight feed arm is provided with a drain stem for blowing out or draining sight feed glass. The pipe thread on support arm is $\frac{1}{2}$ inch on all sizes except the 4 and 8 pint, on which it is $\frac{3}{4}$ inch.

Capacity, Pints	Detroit Imp. Std., Each	Michigan Cyclone, Each	For Cylinder, Diam., Ins.	Approx. Weight, Pounds

2	22.80	17.10	18-30	14
4	33.50	25.90	30 and up	26
8	43.00	33.00		29

Detroit "Improved Standard" and Michigan "Cyclone"

Lubricator with Bracket

For engines in which there is considerable vibration as on steam shovels, hoisting equipment and steam hammers. The bracket support is not affected by the vibration which often breaks the ordinary type of lubricator arm. Made extra heavy with rough body and finished trimmings. Especially adapted for the exacting service demanded by this class of engines.

Capacity, pints.....	$\frac{1}{2}$	1	2
Detroit.....	\$14.50	\$18.80	\$24.60
Michigan.....	10.50	14.20	18.70

Detroit "Zero" and Michigan "Giant"

Double Connection Lubricators

Zero and Giant Lubricators are for use in outdoor service, particularly in exposed places subject to low temperatures. The Zero Lubricator is made in two styles. Style A is for installation with both connections between boiler and throttle. Style C is designed to take steam above throttle and deliver oil below throttle either into steam pipe or directly into steam chest. Style A always furnished unless Style C is ordered.

Detroit "Improved Standard" and Michigan "Rural"

Sight Feed Lubricators—Single Connection

The single connection lubricators are very simple in their general construction to the double connection, except their design is modified to make them single connection style. They are intended for the same general use as the double connection type where the latter type cannot be installed because the arrangement of the equipment. Wherever possible, however, we advise the use of a double connection lubricator in preference to the single connection type because any lubricator with two connections to the steam pipe has better condensation and consequently better feeding qualities. In the $\frac{1}{2}$, $\frac{3}{4}$ and 1-pint sizes the filler and upper gauge arm are combined, eliminating the gauge.

Capacity, Pints	Detroit Imp. Std., Each	Michigan Rural, Each	Pipe Thd. on Support Arm	Approx. Weight, Pounds

2	23.60	18.20	$\frac{1}{2}$	18

"Detroit" and "Michigan"

Cylinder Grease Lubricator

For feeding grease lubricants to the cylinders of steam engines.

To insure a uniform lubrication it is necessary to keep the grease in a liquid state. To accomplish this the lubricator has a large internal heating surface, the heat being supplied by a current of live steam which passes on to the cylinder. There is no loss of heat units and no accumulation of water.

Capacity.....	$\frac{1}{2}$ Pt.	Pint	Qt.	2 Qts.
Detroit.....	\$15.80	\$21.90	\$28.70	\$37.30
Michigan.....	14.50	19.00	28.50	

Detroit "Zero" and Michigan "Giant"

Single Connection Lubricators

The single connection Zero and Giant lubricators are intended for the same service as the double connection type in places where the arrangement of the equipment does not permit the installation of a double connection lubricator. Their construction includes an automatic oil heating arrangement whereby the oil is always kept hot and a regular feed of oil is thus assured when the engine is exposed to cold weather.

Price Each

Capacity, pints.....	$\frac{1}{4}$	$\frac{1}{2}$	$\frac{3}{4}$	1	2

16	6.00	1/2	Polished	4	6x12
17	8.00	1/2	Polished	4	6x16

Chain Lever Water Gauges

Made with extra large, square body, and heavy packing nuts. Steam can be shut off quickly if glass breaks. Intended for use on large boilers where water column is located very high. Horizontal position of levers indicates gauge is open to boiler. When right hand levers are drawn down 45° gauge blows down, and when vertical gauge closes and drains. Any length glass to 20-inch furnished.

No. 53. Glass 6x12 inches, shank, 1/2 inch. Price each.....\$18.00

No. 54. Glass 6x16 inches, shank 3/4 inch. Price each.....\$20.00

Longer glass furnished if required.

Penberthy "Safeguard" Water Gauge

A high grade, square body, water gauge constructed so that when a gauge glass breaks the lower valve closes absolutely tight against the boiler, preventing release of scalding water, as is the case where ordinary gauges are used. The lower valve is made in such a way that it will not close automatically unless the glass breaks.

Operates perfectly on any pressure. No springs are used and no adjustments of any kind are necessary.

Number	Price	Size Shank	Size Glass
1	\$5.00	3/8 or 1/2	6x12
2	6.50	3/8	6x16

Longer glass furnished at additional charge.

Gauge Glass Washers

Gilbert's self packing gauge glass protectors shown in the right hand illustration are packed 1 dozen in a box, except the 1-inch size, which is packed 6 in a box.

Size, inches	1/2	3/8	5/8
Round flanges, per dozen	\$0.20	\$0.20	\$0.20
Square flange, per dozen	.20	.20	.20
Gilbert's per box	1.50	1.50	1.50

Fig. 142

Eclipse Safety Water Column

For both high and low water alarm. They have few intricate parts and are absolutely reliable. Made with any variation between alarms, and adapted for either right or left hand.

All parts are attached to top flange and can be easily removed.

No. 1. Medium, glass 12-in., with trimmings.....\$30.00

No. 2. Large, glass 15-inch, with trimmings.....\$35.00

In ordering always state boiler pressure carried.

Moncrieff Water Gauge Glasses

Suitable for use with steam pressures up to 200 pounds. The life of gauge glasses can be materially lengthened by careful packing. Glass should not be too large for glands; gauge corks should be perfectly true and steam turned on very slowly. Glasses run from ¼-inch to ½-inch under size. Packed ½ dozen glasses in a package.

Pressure, Vacuum and Altitude Gauges

Single Spring

Vacuum

Compound Pressure
and Vacuum

Hydraulic Gauge

Altitude

Our line of pressure and vacuum gauges has been greatly improved. The principal development lies in the improvement of the teeth of the gearing in the segment and pinion. The new development consists of a special design of long tooth of involute form, having a much longer arc of contact than the gearing usually furnished in gauges. All bearings are of large diameter and broad face. The bearing screws are German silver and working in phosphor bronze links or connections, give ideal bearing conditions, thus insuring maximum strength and durability. The pinion and segment staff are also German silver running in phosphor bronze bearing. The gauge spring is of special construction adopted after exhaustive experiments, and hydraulically tested before being shipped.

Single Spring Pressure or Vacuum Gauges

This type of gauge is intended for all service where there is no rapid fluctuation in pressure or external vibration, and the pressure medium will not deteriorate brass. The only difference in the construction between the vacuum and pressure gauge is the reversal of the tube spring causing the gauge to register inches of vacuum instead of pounds pressure. The price for either vacuum or pressure gauge is the same.

The standard graduation is 200 pounds, but 30, 100, 160, 250, and 300 can also be furnished from stock, and 500 and 1,000 to order. Vacuum gauge graduated for 30 inches.

The pipe connection is $\frac{1}{4}$ -inch male. A T-handle cock is furnished with all gauges to $6\frac{1}{4}$ -inch, and a union cock with larger sizes.

Double Spring Pressure Gauge

Designed for any pressure medium which will not deteriorate brass, and where the service is too severe for the single spring type. In the 8½, 10 and 12-inch sizes the movement is mounted on the socket independently of gauge back. Graduations on dial furnished for 100, 200, 250, 300 and 500 pounds, but 200 pounds is considered standard. Pipe connection $\frac{1}{4}$ -inch. T-handle cock furnished with sizes up to $6\frac{1}{4}$ -inch, inclusive, and union cock on larger sizes.

12	55.00	56.50	80.00	84.00	17

Altitude Gauge

For indicating the height of water in tanks, reservoirs, standpipes, heating systems, etc. The interior mechanism consists of a single spring standard geared movement. The standard graduation is for 70 feet of water, but special graduations from 50 to 1,150 feet can be made to order. The black hand indicates the head of water in feet and the red index hand can be set by the user at any desired point on the dial. The pipe connection is $\frac{1}{4}$ -inch male. Prices include a T-handle cock for sizes $4\frac{1}{2}$ to $6\frac{1}{4}$ -inch, inclusive; a small union cock for sizes $8\frac{1}{2}$ and 10-inch and a large union cock for 12-inch size.

Trip Gong Bells Polished Brass

For use in schools, factories and stores or in any place where opening and closing hours must be indicated by signal. Also used extensively for fire alarm signals. It can be handily arranged to ring on different floors in unison. They are superior to the electric gongs because they are always ready for instant use, while the electric gongs are very uncertain. These gongs can be operated with up or down pull. Right hand sent unless otherwise specified, but the

left hand can be furnished upon request. Built substantially for hard usage and will not crack. Bells 10 inches or over have wooden hammers. Illustration shows right hand bell.

Crane Gong

Guard against accidents by using a signal gong in your shop. Especially useful on all cranes and construction work. This gong is so well known and widely advertised that to explain its advantages is unnecessary. It is made of pressed steel—not cast. Contains only five parts, all of which work in perfect union with an action as smooth as oil. Crane operators can indicate whether he intends to stop, go forward or backward—one ring for each pressure of foot on front push pin. In addition, another pin is provided which is responded to by thirty or forty loud clear rings. Saves many stuns and starts and leaves operator with both hands to run crane.

Brass Steam Whistles Common Steam Whistles

No. 5

These brass steam whistles are of the highest quality throughout in both material and workmanship. Made of seamless tubing, perfectly smooth on the inside and gives a good clear resonant sound. The length of the bell in all cases is twice the diameter. However if so ordered, we can furnish long bells three times the diameter or extra long bells $3\frac{1}{2}$ times the diameter. In ordering state diameter of bell and figure number.

Single Bell Chime Whistles

No. 1

Made of solid cast bronze and not built up with a web inside of a lap welded tube. Have high grade steel spindle and are exceptionally well made, durable and ornamental. Recommended for marine and stationary work, fire alarms, etc. For low pressure loosen acorn nut on top until whistle gives desired tone; for high pressure, vice versa.

Penberthy Auto-Positive Injector

Automatic and Restarting. For High Pressures and Hot Water Supply

While a large majority of boilers carry less than 150 pounds steam pressure, the usual high pressure of the ordinary automatic injector, there is an increased demand for an injector operating between 150 and 200 pounds pressure. There is also a demand for an injector that will handle a water supply that has become heated by the use of the siphon (or ejector) and in other ways, and is consequently too hot for injectors of the usual automatic type. The "Auto-Positive" injector is especially designed to meet these demands.

This injector differs materially from any other automatic injector ever before placed on the market, being constructed on new principles, having but five working parts, and combining the features of a positive with those of an automatic injector. By this combination it is possible to handle much hotter water and work on higher steam pressures than any other automatic injector. It will handle a hot water supply as follows, from a head:

Temperature 135° to 140° Fahr. at 75 to 100 pounds steam pressure.
 Temperature 130° to 135° Fahr. at 50 to 120 pounds steam pressure.
 Temperature 118° to 120° Fahr. at 25 to 150 pounds steam pressure.
 Temperature 98° to 100° Fahr. at 18 to 175 pounds steam pressure.

No.	Price Each	Horse Power Allow. 7 1/2 to 8 gals. per H. P. per Hr.	Size of All Pipe Connections	Capacity per Hour, 75 to 125 Lbs. Steam 3 ft. Lift, Gals.		Shipping Weight, Pounds

H.Channon Company Chicago

Chicago Automatic Injector

The Chicago Automatic Injector is one of the simplest on the market, compact and clean cut in design, and efficient in operation. It consists of but three tubes, the body or shell, one check valve and a bushing. All of these parts are held in place by screw threaded joints and cannot drop out and become lost. Owing to the extreme simplicity of its construction, the Chicago is very easy to clean and repair. Both steam jet and forcing tube may be removed by the use of a monkey-wrench, and

when cleaning becomes necessary it may be accomplished without breaking any pipe joints or removing injector from boiler, and without the aid of special wrenches by simply removing the bottom cap.

The table of capacities given below is based on the following conditions: Steam 80 to 100 pounds; lift 1 to 3 feet; feed water 76°F.

Size No.	Price Each	All Pipe Connections, Inches	Capacity Gallons per Hour, Maximum	Horse Power Based on Ordinary Tubular Boiler	Approx. Weight, Pounds
00	\$ 16.00	3/4	80	4 to 11	4

16	200.00	4 1/4	500 to 750	4500	2500

In every feature it is the equal of any injector made. It is easy to operate. Turning on steam starts the injector.

It is automatic with wide open suction at lower steam than any other. With throttled suction it is automatic at any pressure sufficient to enable injector to get the water. It works equally well as a lifting injector or as a non-lifter.

No amount of jarring can cause it to break. A traction or portable engine may be run over rocks and stumps or into ditches, but the U. S. will not stop working so long as the suction pipe or hose is under water.

A distinctive feature of the U. S. is the drip-cock which has many advantages such as draining the injector when not in use, preventing freezing, is always handy for drawing hot water, when injector is working, etc.

U. S. Injector

Garfield Double Jet Injector

The advantages of the Garfield Double Jet Injector over the ordinary single tube type lies in the fact that it will operate under a wider range of steam pressures, will give better results

when taking water from a long lift, can be graded closer, and will deliver the water at a much higher temperature than machines of the single tube class.

Another important feature of the Garfield Double Jet Injector is that it is self adjusting, that is, the higher the steam pressure under which it is working, the more water it will deliver. The Garfield is one of the simplest double tube injectors made, containing fewer working parts than any other machine of its class.

It is constructed of the best new metals by skilled mechanics and is thoroughly inspected and tested in actual service before leaving the factory.

The actual capacities exceed those listed and are fully equal to any injector of the same size, pipe connections and price.

The capacities given in the table below are based on the following conditions: Steam 80 to 100 pounds; lift 4 feet; feed water 76 degrees.

Size No.	Price Each	All Pipe Connections	Gals. per Hour	Horse Power	Wt., Lbs.

Model N Metropolitan Injector

Model N Metropolitan Injector

This is a self contained, automatic or restarting injector. It is operated entirely by one handle and does not require the manipulation of valves in the steam and suction pipes for different steam pressures, a feature which makes it particularly desirable where the injector is operated frequently. This result is obtained by a sliding steam nozzle. Furthermore the Model N is absolutely automatic and will restart after an interruption of

Repairs for Model N Injector

the water supply, and is, therefore, well adapted for service on traction or portable engines where the injector is subjected to severe jars. The capacities given in the table are for the pressure stated, cold feed water and with a two foot lift and in view of the fact that very high or very low steam pressure, increased lift or increased temperature of water supply decrease the capacity, allowances for these conditions of 30% have been made in the horsepower appearing in the table.

Repair Parts for Model O Injector and Hancock Inspirator can be supplied.

"XL-96" Improved Ejector

Syphon or Jet Pump. Lifts 20 to 25 feet. Elevates 50 to 75 feet

The lifting and elevating power is so combined in the "XL-96" Ejector as to make it one of the best devices of its kind. Other ejectors which will lift 20 feet will

elevate but 20 to 25 feet additional, and this only on very limited steam pressures, and it is therefore necessary to locate other injectors to within a few inches of the surface of the water and operate with excessive steam pressure if it is desired to transfer water any great distance vertically. Operated with 80 pounds of steam "XL-96" Ejectors will lift 25 feet and elevate 50 feet delivering 15 pounds of water per one pound of steam. Special ejectors of all kinds can be furnished.

Size No.	All Brass Price Each	Iron Body Brass Jets Price Each	Capacity 40 to 65 lbs. steam, 3 ft. lift, gals. per hour	Pipe Connection		Wght. lbs.

Sizes 5 and 6 will be furnished in all brass, unless ordered iron body, brass jets and steam connection. Sizes 7 to 10 will be furnished with iron body, brass jets and steam connection unless all brass is specified.

Ejectors or Steam Jet Pumps

Hancock

H. D. Model C.

H. D. Model P.

H. D. Drive Well

Hancock

This ejector is manufactured by the makers of the well known Hancock Inspirator. It will lift water 25 feet and elevate it 15 feet above the injector, when working with 60 pounds steam pressure.

Sizes 1, 2, 3 and 4 are made entirely of brass. Sizes 5, 6 and 7 have iron bodies with brass unions for steam and suction connections. Sizes 8, 9, 10 and 11 have iron bodies with brass union for steam connection only.

N	8.00	2	2 1/2	500 gal.	3 lbs. 3 ozs.

* Number of gallons of water heated from 70 degrees to 210 degrees in 30 minutes with 70 pounds steam pressure. To secure a noiseless operation a tank of sufficient depth must be used.

H. D. Model C.

In H. D. Ejectors will be found the same superior materials and workmanship which are characteristic of Metropolitan Injectors. The bronze compositions in the bodies and tubes are identical with those in the injectors.

Size 6 has iron body, balance bronze. Sizes 7 and 8 have iron bodies and delivery connections, balance bronze. Size 9 has bronze tubes, balance iron. Size 10 has iron body, bronze tubes, all connections flanged.

H. D. Model P.

This ejector is the same in general details of construction as the Model C, except for the delivery connection which in Model P is furnished without a coupling. This connection is female and in the body of the ejector.

Sizes 6, 7 and 8 have iron body, balance bronze. Size 9 has bronze tubes, balance iron.

Steam Jet Pumps or Ejectors

Blakeslee Steam Jet Pumps

The Blakeslee Steam Jet Pump is operated by a relatively small jet of steam entering the pump body and expending its energy upward. As it enters the pump, its pressure moves the air upwards and in so doing is condensed, thus causing a vacuum. This vacuum in turn causes the liquid at the suction end of the pump to follow the line of steam energy. This jet pump is not intended for boiler feeding but for moving liquids in mills, mines, tanneries, etc., from one level to another. Capacities given in table are normal at 50 lbs. boiler pressure.

Prices of Pumps With Brass Fittings

No.	Price Each	Suction Pipe, Inches	Discharge Pipe, Inches	Steam Pipe, Inches	Steam Opening, Inches	Capacity, Gallons, Per Hour	H. P. of Boiler Required	Approx. Weight, Pounds

Blakeslee Bilge Pumps

Will raise a large amount of water with but little steam. Not intended for elevating great heights, but will make 18 to 20 feet suction. Should be set so the discharge opening will be about on a line with point of discharge. The water may be conveyed from the pump by a trough, or a discharge pump may be connected.

Chicago Ejector

The Chicago Ejector is neat in appearance, strongly made of the best steam metal and is extremely simple in construction, thus insuring ease in repairing. The jets are made of a special composition bronze, which is particularly adapted to withstanding the action of water containing sand and acid substances which these instruments are frequently called upon to handle. With 80 pounds steam pressure this ejector will lift water from 15 to 20 feet and elevate it from 40 to 50 feet.

Self Cleaning Straight Away Strainer

It has a cast iron body with perforated brass strainer cylinder. Self cleaning—simply open the blow-off valve (without removing the strainer). Installed on either horizontal or vertical lines. When steam is shut off from the line and the blow-off valve is open, the steam line is drained of all condensation, which prevents freezing. 2-inch perforations furnished for liquid service unless otherwise specified.

Made in sizes from 1/2-inch to 3-inch. When ordering specify for what service.

Gripwell Tires are guaranteed for three thousand five hundred miles of service.

H. Channon Company Chicago

Channon Standard Brass Valves

Screwed Connections

Channon Standard Brass Steam Valves are made from a high grade steam bronze, uniformity being assured through the use of only new metals, scrap of any kind is never used. They are guaranteed full weight and sufficiently strong for 125 pounds steam pressure and each valve is thoroughly tested before leaving the factory. Valve manufacturers usually make three grades of valves, Heavy Standard, Standard and Competition. When comparing our prices on valves, it should be remembered that Channon Standard Valves are Heavy Standard, not Regular Standard or Competition. Experience has proven that cheap valves are cheap only in the first cost, therefore we do not sell light weight valves unless they are particularly specified.

Channon Jenkins Disc Brass Valves

Screwed Connections

The ordinary Jenkins Disc Valves while made in the same general design as the Jenkins Bros. Valves, are not equal to the original pattern. Channon Jenkins Disc Valves are not only interchangeable with the corresponding sizes of Jenkins Bros. Standard Pattern Valve parts, but the metal used contains the same proportion of copper, tin, etc. We therefore offer these valves to customers who prefer the Jenkins Disc type as being exactly the same in every respect as the Jenkins Bros. Standard Pattern Valves. We can furnish them only in the Globe, Angle and Horizontal, Angle and Vertical Check patterns.

Smolensky Rotary Check Valve

Standard Screwed

Guaranteed Working Pressure: Steam, 150 Lbs.; Water 180 Lbs.

It has no screws, nuts or hinges to work loose, nor a ball which necessitates removing the valve to clean, but consists of a housing, plug and ring only.

The housing is cast with solid seat, has a bevel finish, and ribs on the inside which hold the plug in position. When valve is open, fluid enters through holes in the plug side.

The seating edge of plug is fitted into the beveled valve seat and the brass retaining ring keeps the plug in the housing.

The valve plug slides back and forth on the ribs of the housing. It operates in any position and can be used for any fluid. The area of valve is larger than that of the pipe.

Straightway or Gate Valves

Screwed Flanged Hub End

Standard Pattern

Standard straightway or gate valves. Opens to the left. Wedge gate. Non-rising stem. For steam working pressures up to 125 pounds. Water working pressures 40% greater on sizes 12-inch and smaller; 20% greater on larger sizes.

Hub end valves are intended for hydraulic service only. For water working pressures sizes 12-inch and smaller up to 175 pounds; size 14-inch up to 150 pounds. All valves have 2-inch square head on stem.

Genuine Jenkins Bros. Valves

Standard Pattern Brass Valves

Jenkins Bros. standard pattern brass valves are designed and guaranteed for a working steam pressure of 150 pounds. Made of special high grade steam metal and have the Jenkins disc. Jenkins disc removing nut and nut lock, the keyed stuffing box and other features.

Powell Model Star Brass Valves

Globe Pattern

The body and trimmings are cast of steam bronze composition which conforms to the requirements of the Bureau of Steam Engineering, U. S. Navy Department. The bonnet is connected to the body in such a way that the contact of the bevel faces make a steam tight joint. There is no lead or other cementing material necessary on the body threads or on the bonnet threads. The disc is attached to the stem by a disc nut lock which is held by a wire ring snugly fitted to a groove in the stem, permitting it to swivel freely. Stem and disc of the 1/2-inch and smaller valves are made in one piece and do not swivel. Disc and seat are easily regrindable by using fine sand or ground glass without disconnecting valve from piping. Wheels are cast iron japanned black and can be removed if desired. Round knobs outside rim permit a firm grip for the hands.

Radiator Valves for Steam and Hot Water

Hot Water

Union Elbow

Angle with Union

L. H. Corner

Offset

Our radiator valves are strong and well made, neat and attractive in appearance, and are made for real service, not merely to sell. Every steam valve is tested to 60 pounds pressure before leaving the factory, although the service is rarely more than 10 pounds. The packing nut is heavy and provides a large space for packing. All valves are fitted with black enameled wood wheels and heavily nickel plated all over, the body being rough and the trimmings highly polished.

Skinner Valve Reseating Tools

These tools are a necessity in every plant using Globe or angle valves. Their operation is so simple that any mechanic can use them without previous experience. They do not grind the seat, but cut it, leaving it smooth and polished. Valves to be reseated are not disconnected from pipes and they may be reseated many times.

By using the bonnet of the valve with the taper bushing, as illustrated, perfect alignment is assured.

Tools are highly polished and packed in varnished cases.

No. 1. For 1/2 to 2-inch valves. Price per set. \$20.00
No. 2. For 1/2 to 3-inch valves. Price per set. 30.00

Important: When ordering, state make of valves it is desired to reseat, as an outfit is adaptable for one make of valves only.

Straight Stem

Hot Water Thermometer

Accurately indicating the temperature of the water in a hot water heating apparatus.

They are unsurpassed for accuracy, sensitiveness, durability and practical construction.

Each thermometer carefully tested and fully guaranteed, and carefully packed and boxed.

Straight, price each.....\$2.50

Angle, price each.....2.80

Heating Boiler Gauges

Altitude

Steam Pressure

The Altitude gauge indicates at boiler, height of water in feet in the system. Short hand denotes height water should be kept and long hand registers the actual height of water at all times.

Price each.....\$3.50

The Steam gauge is of the Bourdon single spring type and is constructed to prevent corrosion of parts, especially adapting it for use in basements, etc.

Price each.....\$3.50

Combined Altitude Gauge and Thermometer

(Patented)

For Hot Water Heating Systems

This gauge meets all the requirements of two separate instruments commonly used on hot water heating boilers. It can be fitted into half-inch opening regularly provided in boilers, for thermometer. It registers the height of water in feet and the temperature. Both registers are accurate. All parts which come in contact with moisture are made of non-corrosive material. Price each...\$5.00

Iron Cocks

Straight Way

Three-Way

For Working Pressure up to 125 Pounds

All iron cocks should never be used with steam or water, as the plug will stick in the barrel, making it almost impossible to turn. Iron cocks with brass washers are recommended for this use.

Straightway Square or Flat Head

Screwed for Iron Pipe

Fig. 6
Check and Waste

Vulcanized Asbestos Groove Packed Iron Cocks

$\frac{1}{2}$ to 2-in. for 125 pound steam pressure.
 $\frac{2}{3}$ to 3-in. for 100 pound steam pressure.
The plugs are carefully finished and barfed to render them rustless. The plugs have no metallic bearing, coming in contact with asbestos only, the elasticity of which compensates for the differential expansion and contraction. Extensively used for boiler service. Recommended for use where ground plug cocks are unsatisfactory. Cocks should be opened wide, not partially opened.

Everlasting Blow-off Valve

It is composed of a top and bottom bonnet, a disk and a lever and post.

By pressing down the square head with a wrench the valve is opened and by reversing it is closed.

The operating post is held down by a stiff bronze spring, doing away with a stuffing box and making it absolutely tight.

Iron body—Naval bronze working parts, bronze to iron wearing surfaces.

Screwed, each.....	\$5.00	\$5.50	\$7.80	\$13.25	\$17.25	\$23.00	\$28.75

Note.—The angle pattern is furnished in sizes from ½ to 12 inches only.

Throttle Valves

For steam working pressures up to 125 pounds.

These throttle valves are extensively used on hoisting and traction engines, are opened by one-quarter turn of handle, and are provided with stops.

Always specify brass throttle valves when ordering.

Size, inches.....	¾	1	1¼	1½	2	2½
Price each.....	\$10.00	\$11.50	\$14.00	\$20.00	\$25.00	\$35.00

Blow-Off Valves

**Homestead Brass
Straightway Valves**
Screwed Connections

200 Pounds Working Pressure

Can be fully opened or closed with a quarter turn. The unobstructed passage especially adapts it for handling heavy liquids or carrying off sediment as in case of a blow-off valve.

Size, ins.	1/4	1/2	3/4
Price each	\$3.83	\$3.83	\$4.00
Size, ins.	1	1 1/2	2
Price each	\$4.50	\$5.37	\$7.17
Size, ins.	1 1/2	2	2 1/2
Price each	\$9.60	\$13.40	\$23.30
Size, ins.	2 1/2	3	3 1/2
Price each	\$35.00	\$60.40	
Size, ins.	3 1/2	4	
Price each	\$104.13	\$120.40	

**Homestead
Straightway Valves**
Semi-Steel Body, Brass Plug

200 Pounds Working Pressure

Screwed Connections
The semi-steel is close grained and extremely tough, about 2 1/2 times stronger than average cast iron. Not suitable for service where subject to heat, as the difference in expansion of the two metals may cause the plug to stick.

Size, ins.	3/4	1	1 1/2
Price each	\$10.22	\$10.22	\$12.80
Size, ins.	1 1/2	2	2 1/2
Price each	\$16.66	\$24.00	
Size, ins.	2 1/2	3	3 1/2
Price each	\$35.55	\$62.22	

**Homestead Brass
Three Way Valves**
Screwed Connections

200 Pounds Working Pressure

Prices
Size, ins. 1/4 1/2 3/4
Price each \$6.34 \$6.67 \$6.90
Size, ins. 1 1 1/2 2
Price each \$15.80 \$19.30 \$22.90
Size, ins. 2 2 1/2 3
Price each \$36.60 \$60.80 \$93.30
Can also be supplied with semi-steel body, and brass plug.

Prices as follows:			
Size, ins.	1	1 1/2	2
Price each	\$16.96	\$23.33	\$26.66
Size, ins.	2	2 1/2	3
Price each	\$40.00	\$55.55	
Size, ins.	3	4	
Price each	\$75.55	\$137.77	

**Homestead
Four Way Valves**
Semi-Steel Body, Brass Plug

200 Pounds Working Pressure

Screwed Connections
Very successful on air and cold water pressures—not advised for steam or where subject to heat, as the difference in expansion of the two metals may cause the plug to stick.

Price each	\$127.69	\$177.77	

Jenkins Bros. "Y" or Blow-Off Valve

While best known as a blow-off valve, for which service it is particularly adapted, it is also used successfully for a variety of other purposes, especially where thick fluids are handled, as for instance, in sugar refineries, pulp and paper mills, chemical and dye works, and the like. Fitted with Jenkins disc and renewable seat rings.

Brass, Standard Pattern, Screwed Ends

Size, inches.	1/4	1/2	3/4	1	1 1/2	2	2 1/2

Powell "Cyclone"

Iron body, brass mounted. Both seats and discs regrindable. Reversible and renewable.

The disc holder, D, is given a centrifugal motion when opening and closing the valve, by the steam striking the spiral grooves cast around the sides. This motion tends to keep the inside of walls of the valve clean, as it does not give the scale or sediment a chance to collect. The plunger in passing the inlet orifice, shuts off the steam before the disc reaches the seat, and the vacuum created by the rush of matter through the valve prevents any scale or silt from lodging on the seat. Each valve is tested to 250 pounds.

Size, inches.	1/4	1/2	2	2 1/2	3
Screwed, each	\$7.50	\$10.00	\$13.50	\$18.20	\$27.50
Flanged, each	8.70	11.20	15.00	20.00	30.00

Powell Straightway or "Y" Blow-Off Valve With Reversible Inserted Seat Ring

Like all Powell products it is of the very best material and workmanship and will give satisfaction in the difficult work for which it was designed.

Medium, for 175 lbs. Pressure

Size, inches.	1/4	1/2	1 1/2	2	2 1/2
Screwed. Price each	\$3.00	\$4.00	\$5.00	\$6.50	\$9.25

Extra Heavy, for 300 lbs. Pressure

Size, inches.	1/4	1/2	1 1/2	2	2 1/2
Screwed. Price each	\$6.00	\$8.00	\$10.00	\$13.00	\$19.00

Muffler

No. 1158

Fig. 154. Low pressure pattern. Set for any pressure not exceeding 30 pounds. Has been adopted generally by leading makers of house heating boilers. Same construction as is used in high pressure valves. Heavy pipe wrenches should not be used in connecting them.

Fig. 148. For stationary, portable and marine engines. Made to comply with the rules of the U. S. Board of Supervising Engineers of Steam Vessel Inspectors. Only best non-corrosive metal is used and each valve is tested and adjusted before leaving factory. Suitable for any pressure up to 200 pounds.

Fig. 148C. Exactly the same as Fig. 148 above, except with lock-up attachment and is especially adapted for export trade wherein a lock-up device is required.

Fig. 149. For marine and stationary boilers. Especially adapted for use on yachts and steam launches where it is necessary to pipe escaping steam away from boiler. For any pressure up to 200 pounds. When ordering state whether for marine or stationary use.

Fig. 149A. This valve is the same as Fig. 149, except that it is equipped with a lock-up attachment and is especially adapted for export trade where it is desired to use a lock-up device.

Fig. 1158. For road rollers, traction engines or any place where it is desired to muffle the sound of escaping steam. Muffler does not retard or affect relieving capacity. For any pressure up to 250 pounds. Furnished in polished brass only.

Figs. 148, 148C, 149 and 149A are regularly furnished semi-finished, but can be furnished in polished brass at slightly additional price. Lock-up valve, and valves which are used where state laws regarding safety valves are in force, prices are slightly higher.

Always state size, number and pressure at which valve is to be set.

American Iron Body Bronze or Nickel Seat Safety Valve

Fig. 116
Outside View Showing
Screwed Base

Furnished with flat seats for stationary boilers and beveled seats at an angle of 45 degrees for marine boilers. Suitable for any pressure up to 200 pounds. Thoroughly adjusted and tested before leaving factory, and guaranteed to be absolutely accurate at time of shipment. Furnished with either flanged or screwed base connection. Elongated base is also threaded, as shown in cut at right hand side of page. Fitted with blow-down ring for means of adjustment from outside casing.

When ordering state size, style of base, whether bronze or nickel seat relieving pressure.

Brass, Water and Cylinder Relief Valves

For Pumps, Steam Engine Cylinders, Pipe Lines, Tanks

With Cap or Wheel—for pressures up to 200 pounds.

These valves are used on the ends of the cylinders of steam engines and obviate all danger of blowing out cylinder heads on account of accumulation of water in the cylinder.

Furnished with cap and male base connection, or with wheel and female base connection, as desired, at the same price. The cap may be removed, which exposes a nut, the manipulation of which determines the pressure at which the valve will relieve. The relieving pressure is set, on the other style, by the wheel. When ordering, state the pressure at which valve should relieve. Valves are guaranteed accurate when leaving factory. We cannot be responsible for adjustments made thereafter.

Size, inches.....	1/2-3/4	1	1 1/4	1 1/2	2	2 1/2	3	3 1/2	4

When ordering, always state Fig. No., size, and pressure at which valve will relieve.

Fig. 150

Fig. 1128

Wide Body Water Relief Valve

With Cap or Wheel

Relief valves made with a wide body have a much greater capacity than the regular pattern. Made in brass and iron body. Sizes from 2 inches and upward are made either with screwed or flanged bottom. If flanged bottom is desired, state diameter wanted. Be sure to state pressure it is desired valve to relieve.

Prices—Brass

Fig. 144

Fig. 143A

Pressure Regulators

These regulators or reducing valves are intended for service in reducing steam, water and air pressures. Suitable for initial pressures up to 150 pounds. Will reduce to any lower pressure and automatically maintain it regardless of the demand or fluctuations in the high or initial pressure. The delivery pressure may be as low as one pound if the regulator is counter-weighted by suspending weights from the opposite end of the lever to overcome an actual weight of the internal parts.

No. 0 regulator is for service where there is no sudden variation of volume, as for heating coils, etc. It is fitted for a dashpot, which can be added if necessary after being installed.

No. 1 regulator with dashpot is used where there is a sudden variation in volume used, as on an engine or pump, also when required to control a number of heating coils or other apparatus.

When ordering, state initial and reduced pressures and whether for water, steam or air service.

No. 0 Without Dashpot

Price Each

No. 1 with Dashpot

Low Pressure Regulators

Will reduce steam, air or water pressures. Especially adapted for vacuum steam heating systems, also atmospheric or very low pressure steam heating. Suitable for initial pressures up to 150 pounds and reduced pressures not exceeding 8 pounds. When ordering state initial and reduced pressures and whether for steam, water or air. It is operated by an independent diaphragm controlled by pressure through a small pipe direct from the low pressure system at a distance from the regulator where the pressure is about average excepting on sizes 1 1/2 inches and under, where this connection is made through the bottom of valve cap.

No. 3 regulator is a straightway valve with inlet and bottom connection the same size. Sizes 2 to 6 made screwed or flanged ends, but screwed furnished unless otherwise ordered. Larger sizes, flanged ends.

No. 4 is exactly the same as No. 3 except that it has an expanded outlet and is especially adapted for controlling heating mains. Sizes 1x2 to 2x4 screwed ends, 2 1/2x5 to 3x6 inlet screwed and outlet flanged, 3 1/2x7 and larger flanged ends.

Weight, pounds	16	18	20	30	55	65	81	135	145	190	260	450	525

Foster Q Pressure Regulator

For air or steam heating systems. No weights or close fitting pistons; easily adjustable for pressures between 0 and 15 pounds. Sizes 2 inches and under are fitted with brass bodies, larger sizes have iron bodies.

Foster U Pressure Regulator

A water pressure regulator equally adaptable for air service under certain conditions. Reduces 300 pounds initial pressure to a final of from 5 to 200 pounds. Sizes 1/2 to 2-inch, all composition; 2 1/2 to 12-inch, iron body, composition mounted.

Foster Float Valve

Auxiliary operated (can also furnish "direct-acting type"). Quick, sensitive and non-leakable. Functions with pressure in a supply pipe. Automatically controls admission of steam to pump, returning condensation. Size up to two inches, inclusive, all composition. Larger sizes, iron body, composition mounted, and fitted with removable seats.

Fisher Float Valve for Open Tank Service

Type 17

For open tanks where a fixed level of water or other fluid is to be maintained. Automatically controlled by a seamless copper float, directly connected to lever by an adjustable stem. Made in angle and globe types.

All valves are tested. The standard are suitable for cold water or air pressures up to 200 pounds. If used for hot water, steam, oil or other service, we must be advised, otherwise we ship angle type standard valve.

Fisher Combination Back Pressure and Exhaust Relief Valve—Cushioned

Type 20

Condensing and non-condensing systems sometimes require a valve that can be used either as a back pressure or automatic exhaust relief valve. At others a lever controlled relief valve is preferred. For non-condensing service, it is weighted for a maximum back pressure of five pounds or by placing weight on opposite end of lever, valve will be held open.

For condensing service it has a water seal to prevent leakage under vacuum.

Recommended for vacuum heating systems. List Prices

Fisher Reducing Valve or Pressure Regulator

Type 10A

Reducing steam, water, air, gas, or oil. Very sensitive, responding quickly to the slightest variation or sudden draw on the service pressure. Reduces any initial power plant pressure to any desired low pressure in one reduction, will not chatter, stick nor allow pressure to build up. Vertical or inverted type. Angle or globe pattern sizes from 1/4-inch to 12-inch.

Fisher Reducing Valve or Pressure Regulator with Increased Outlet

Type 11A

Specially designed for low pressure or any vacuum system of heating. An increased outlet allows quick expansion of steam after passing through the valve from the high pressure side and being so nearly balanced it reduces from high initial pressure to atmospheric pressure or below.

Vertical or inverted type, in sizes from 1/4-inch to 12-inch on the inlet side. Any size outlet.

Tank Controller Type 27

It will control steam supply to pump according to accumulation of condensation in receiver tank, or if pump supplying tank, it will control pump and maintain a fixed uniform level. It can be installed on waterline to control water level or the outflow where tank is discharging into sewer or against no pressure.

It consists of a Fisher balanced lever valve, connecting rods with turnbuckle, bell crank, stuffing box and seamless copper low-pressure float. Tank end of stuffing box has standard pipe thread.

We must have sure information as to service, whether for steam, cold or hot water, and size of manhole in tank.

Controlling devices with angle or globe valves, screwed or flanged openings, take same list. Valves with screwed opening up to 4 inches, inclusive. Flanged valves, 1-inch and larger.

American Dead Weight Gauge Tester

Fig. 312

As accurate as a mercury column, occupies much less space and costs little as compared to a mercury column.

Weights are used in units of 5 to 20 pounds and the reading on the gauge at all points on the dial is instantaneous. In a great many cases it is impossible, by the old fashioned testing apparatus, to hold the pressure on the gauge long enough to compare them.

It is the only instrument by which gauges can be tested accurately without the use of a mercury column.

Furnished complete with all necessary connections, wrenches, etc., for testing and adjusting gauges.

Put up in a neat, substantial box, weights in separate box. This instrument is equal to mercury column.

American Inspectors Outfit

Fig. 325

Especially designed for the use of inspectors and traveling engineers.

This outfit furnished complete with 3½-inch nickel plated test gauge 300 pounds, one hand puller, one hand set, one pair pliers and one screw driver, brooches and files.

Put up in a neat mahogany velvet lined case.
Price.....\$40.00

American Test Pump

Portable test pump for pressures up to 500 pounds.

Pressure is indicated by screwing down the piston.

Can be easily carried in tool kit.

Test gauge furnished extra.
Price, brass.....\$12.00
Price, nickel plated.....14.00

The American-Thompson Improved Indicator

Its record is the most accurate of any indicator made, and by means of the new improved Detent motion several cards can be taken in the time ordinarily required for one. While the Detent motion is of great value on low speed engine indicating, its greatest value is in high speed work. Four cards in one minute have been taken in locomotive indicating.

Each instrument is complete with two cylinder spring, any pressure. Two straightway cocks are necessary to make up right or left hand.

Steam engine indicator furnished with 2-inch drums.

Gas engine indicator furnished with 1½-inch drum.

Both packed in a neat mahogany case.

Steam engine indicator, any type. Price.....	\$55.00

Steam Traps

"Nason" or Standard Steam Trap

The Nason or Standard is one of the oldest and best known types of steam trap on the market and while we do not particularly recommend it, as the later types of traps have many improvements, there are many engineers who prefer it.

The Class B is for steam pressures not exceeding 20 pounds, the Class C for pressures to 70 pounds, and the "Side lug" for pressures from 40 to 150 pounds. Always state whether Class B, C, or Side lug.

Peters Improved Corliss Valve Steam Trap

The secret of the success of the Peters Improved Corliss valve steam trap lies in its simple construction, which necessitates only two working parts to perfectly perform all the duties required of it.

All working parts are made of the best bronze and are interchangeable throughout. The working parts are easily accessible without breaking any pipe connections, by simply removing the head of trap. This operation brings the valve mechanism into plain view, as shown by the illustration on the right, and affords a close inspection of the trap interior.

To by-pass this trap, the by-pass stem is turned in until it bears on the float rod, which operates the Corliss valve and discharges the trap, thereby eliminating the necessity of the troublesome needle valve. The float is re-enforced seamless copper, tested to 500 pounds hydraulic pressure. Each trap is furnished complete with water gauge, air, frost or sediment cocks and by-pass. When ordering, state steam pressure with which trap will be used.

Davis Improved Steam Trap

For any working pressure up to 200 pounds

The Davis Improved steam trap will automatically relieve the water of condensation from a system of steam pipes without loss of steam. It has double cone shaped balanced valves, which are operated by a high pressure seamless copper float tested to 300 pounds pressure, and which are effectively sealed at all times by several inches of water, thus preventing all leakage of steam. It discharges continuously as fast as the water enters the trap, and due to the fact that the valves are balanced, it will operate equally well under any pressure—high, medium or low, without any alterations. Having two valves, the capacity of this trap is greater than a single valve trap, which, when not balanced, must have a small area. As the valves are cone shaped, they cannot stick or be affected in any way by oil, grease, sediment or foreign matter which may enter the trap.

The Davis Improved trap is provided with bosses which are tapped $\frac{3}{8}$ -inch so a gauge cock can be attached if wanted. It is also equipped with a $\frac{1}{4}$ -inch air cock, and a by-pass valve in the cover so steam can be given a free passage around the valves if desired. This trap will not return the water of condensation to the boiler, but it will discharge approximately two feet in height for every pound pressure under which it is operating or against any lower pressure.

No.	Price Each	Pipe Connections, Inches	Capacity		Weight, Pounds
			In Lin. Ft. of 1-inch Pipe	In Sq. Ft. of Radiat'g Surface	
00	\$15.00	$\frac{1}{2}$	1,500	500	25
0	20.00	$\frac{3}{4}$	3,000	1,000	40
1	30.00	1	6,500	2,175	60
2	45.00	$1\frac{1}{2}$	15,000	5,000	80
3	60.00	$1\frac{1}{2}$	20,000	6,675	125
4	80.00	2	30,000	10,000	135
5	100.00	$2\frac{1}{2}$	40,000	13,350	240
6	125.00	3	60,000	20,000	250

Strong Steam Trap

The Strong Steam Trap will automatically remove the condensation from any system operated above atmospheric pressure, whether steam, gas or air. The action is intermittent, which causes a pumping effect upon the condensation lying in sags or pockets or collected in drops on the inside of steam lines or coils, etc. It will discharge against any pressure less than the pressure of the trap; for example, if the gauge shows a pressure of 100 pounds the trap will discharge into any system carrying 99 pounds or less. When it is desired to lift the water from the trap to an elevation, the following formula may be used: One pound pressure will raise water two feet in height; therefore if the pressure of the trap is 25 pounds, the condensation may be discharged into a receiver 50 feet in height.

The Strong steam trap is furnished at the same price for four different pressures: Gravity for 10 pounds or less, low pressure for 10 to 30 pounds, standard pressure for 30 to 125 pounds and high and high pressure for 125 pounds and higher. Standard pressure is furnished unless otherwise ordered.

Number	0	1	2	3	4	5
Capacity, lineal feet of 1-inch pipe	3500	5000	7200	12000	17000	30000
Capacity, square feet of radiation	1100	1600	2400	4000	5500	9600
Capacity, pounds of water per hour	350	550	800	1500	2400	3500
Size of pipe connections, inches	$\frac{3}{4}$	$\frac{3}{4}$	1	$1\frac{1}{4}$	$1\frac{1}{2}$	2
Price each	\$27.50	\$30.50	\$40.00	\$55.00	\$75.00	\$105.00

Important.—Be sure to state pressure when ordering.

Chicago Return Tilting Steam Trap

The Chicago Return Steam Trap is one of the greatest economizers of any trap at the present developed, having positive capacity and absolute surety of action. Unlike other tilting traps it differs in having unlimited capacity of the main body, which is fixed and unmovable, the operating tanks and trunnions are very small, and are packed with metallic packing which never burns out. The trunnions are perfectly balanced requiring a minimum amount of pressure on the glands to prevent leaking, and imposing only a trifle of weight on same as compared with all other tilting traps which have to enlarge trunnions and tanks as the capacity increases to carry the extra weight.

Hot condensed water is saved and returned to the boiler with this trap, using only the amount of steam necessary to displace the water in the fixed tank. This is equivalent to about one-tenth the steam required to operate a steam pump, besides saving the heat in the water.

The Chicago Return Steam Trap is applicable to working steam pressure up to 250 pounds, and is designed with a large factor of safety. As all working parts are on the outside, the trap is simply and easily inspected. The tanks are all acetylene welded and galvanized.

No.	Price Each	Pipe Connections, Inches		Capacity in Pounds per Hour
		Inlet	Steam	
A	\$ 90.00	1	1	1783

Cap. lbs. water per hr.	500	725	1200	2000	3000	4000	6000
Size pipe conn., ins.	$\frac{3}{4}$	1	$1\frac{1}{4}$	$1\frac{1}{2}$	2	$2\frac{1}{2}$	3
Price each	\$25.00	\$35.00	\$45.00	\$60.00	\$80.00	\$100.00	\$125.00

For draining condensation from steam apparatus of all kinds, high or low pressures. Discharges condensation automatically into any receptacle and against any pressure, so long as the pressure on the discharge is lower than on the inlet of trap.

Should not be applied to pressures higher than stamped on the brass plate attached to each trap. Will work on lower pressures but at reduced capacities.

The capacity of a trap depends upon pressure on outlet and inlet together with size of discharge valve.

Sarco Steam Trap

The simplest trap made. It can be inserted anywhere in a steam pipe. A Sarco cartridge containing an expansive fluid is inserted into the body. This operates a corrugated hermetically sealed tombar tube.

Size Inches	Low Pressure 6 to 30 lbs. Price, Each	High Pressure 50 to 200 lbs. Price, Each
$\frac{3}{4}$	\$6.00	\$7.75
$1\frac{1}{2}$	6.00	7.75
$1\frac{1}{2}$	9.50	10.35
1	11.25	12.10
$1\frac{1}{4}$	24.15	28.45
$1\frac{1}{2}$	30.25	34.50
2	35.80	45.80
$2\frac{1}{2}$	51.75	60.40
3	60.40	77.65

When ordering steam traps always state the range of pressures.

The Burt

Exhaust Pipe Heads

These exhaust heads are attached to exhaust pipes to prevent the oil and wet steam from escaping upon the roofs of buildings, etc., and to reclaim the steam, as the same water used over and over is preferable to fresh water which contains lime and scale forming sediment.

The base and drips are of malleable iron. The seams being water tight prevent overloading and blowing up.

The operation is such that the steam coming up does not come in contact with the condensed steam, making it possible for only dry steam to escape.

Painted with anti-rust paint.

The Standard

The Burt.—The exhaust steam delivered through the pipe strikes the drum immediately over the inlet; this breaks up the steam into the smallest particles, condensing some of the vapor. The greatest volume rises to the small projector, is cast over to the flange, then forced down the inner wall, and coming out of the opening again rises to the top of the head and seeks its way out at the outlet pipe. When it comes in contact with the cold air, it is condensed into water, which drips down the wall, is caught on trough shaped lugs, drips down the tubes which carry it to the outlet pipe and thence out through the drip.

The Standard.—The separation is made by the utilization of centrifugal force, as the incoming steam is given a whirling motion at the top of the head, the water and oil strike the sides, flow down to the drip outlet at the bottom and do not come in contact with the incoming steam.

Sizes up to 5 inches have heavy screwed base. Larger sizes are fitted with heavy flanges.

Improved Steam Condensing Exhaust Pipe Heads

Escape Dry and Noiseless. No Back Pressure

These exhaust heads completely stop the emission of grease and water from the pipe, and save roofs and walls from deterioration.

Made of galvanized steel, in all sizes from 1-inch to 48-inch diameter of pipe opening.

Gardner Engine Governors

Standard Governors

Standard Governors

Spring Governors

Class A is of the gravity action pattern and is especially adapted for the larger types of stationary engines. In this governor the centrifugal force of the balls is opposed by the resistance of a weighted lever and the speed is varied by the position of the weight on the lever. Has automatic safety stop, which is simple and reliable in action. If belt brakes or slips off pulley the valve is instantly closed. Made in sizes $1\frac{1}{4}$ to 16-inch, inclusive.

Class B combines both spring and gravity actions, and is adapted for all styles of slow and medium speed stationary engines. The centrifugal force of the balls operates against the resistance of a coiled steel spring. By means of a screw the compression on the spring can be changed to give a wide range of speed. A continuation of the speed lever makes a convenient sawyer's hand lever. Governor can be controlled from a distance by attaching a cord to speed lever.

Spring Governors

Spring governors are recommended for traction and high speed stationary engines. They are quick and sensitive in action, responding instantly to changes of load. As the name implies, they are spring-action entirely and work in any position. Class A is fitted with speeder, sawyer's lever and automatic stop. Class B the same, but without automatic stop.

Connection

We regularly furnished the $1\frac{1}{4}$ -inch governors with screwed side and base, the $1\frac{1}{2}$ -inch and 2-inch screwed side and flanged base, and the $2\frac{1}{4}$ -inch and larger flanged side and base. All flanges are United States standard unless otherwise ordered.

No. 55

No. 2. Regular pattern: This governor automatically starts and stops pumps working under pressure, and controls them so as to maintain a uniform pressure on discharge side at all times while in operation. Thousands are in daily use in waterworks, hydraulic elevators, and for fire, boiler feed railroad, mine pump and air compressor service. Simply constructed, easily operated and automatic in action. When ordering state Fig. number, size of pipe, whether angle or globe and screwed or flanged, minimum and maximum boiler and discharge pressure. If used with anything besides cold water name the liquid.

No. 4. Constant excess pressure governor. Guaranteed to maintain a constant over or excess pressure in the feed line at all times, regardless of variation of boiler pressure. Automatically controls and regulates the speed of the pump according to the requirements of the boiler. It is without exception the most durable, convenient, simple and easily operated machine of its kind. We recommend it for hard service where the most exacting duty and closest regulation is desired, and must be maintained. Be sure to give full information regarding pressures, style and working conditions when ordering.

No. 8. Vacuum pump governor. For use on all types of steam operated vacuum pumps used in connection with vacuum systems of heating or wherever a certain number of inches of vacuum must be maintained. It is absolutely automatic and easily adjusted. We guarantee this governor to be thoroughly reliable. Diaphragm and lever mechanism can be swiveled or turned in any direction desired. It is highly essential that we be given complete information regarding pressures, conditions, etc.

No. 55. Spring controlled diaphragm regulating valve. For controlling steam driven pumps operating on closed systems and especially adapted to low pressure pumps. When information is given we furnish a special oil diaphragm for fuel oil pumps.

It can be used as a pressure reducing valve in any position, but for vertical pipe line it should be fitted with pilot guide. Sizes $\frac{3}{4}$ to 1-inch have phosphor bronze bodies and inner parts; $1\frac{1}{4}$ -inch and larger have iron bodies and phosphor bronze valve seats. Also successfully used to control the flow of fuel oil or gas to boiler using the boiler pressure as controlling factor.

All flanged valves are furnished faced and drilled. These valves are for 125-pound steam working pressure. Prices on extra heavy valves furnished on application. Weights given below are for globe pattern, screwed up to $1\frac{1}{2}$ inches and flanged in larger sizes.

Regular Pump, and Excess Pressure, Governors, and Diaphragm Regulators						Vacuum Pump Governors				
Size, Inches	Angle or Globe Screwed	Angle		Globe		Size, Inches	Screwed		Flanged

Standard Wrought Pipe for Gas, Steam and Water

When ordering pipe, it should be clearly specified whether "Wrought Steel" or genuine "Wrought Iron" Pipe is wanted. A great many orders are received which merely call for pipe. On such orders we always ship black wrought steel pipe. A few years ago, owing to the competitive condition of the market, a cheaper pipe was placed on the market and was known as "Merchant or Standard Wrought Pipe." This grade is no longer made, however, and all pipe we sell is full "Card" or "Standard" weight, subject, however, to 5 per cent variation. All weights and dimensions given in the tables below are nominal.

Standard Pipe

Nominal Inside Diameter, Inches	Price per Foot	Nominal Thickness, Inches	Nominal Weight per Foot	No. of Threads per Inch of Screw
1/4	\$0.05 1/2	.068	.245	27
1/4	.06	.088	.425	18
1/2	.06	.091	.568	18
3/4	.08 1/2	.109	.852	14
1	.11 1/2	.113	1.134	14
1 1/4	.23	.135	1.684	11 1/2
1 1/2	.27 1/2	.140	2.281	11 1/2
2	.37	.145	2.731	11 1/2
2 1/2	.58 1/2	.154	3.678	11 1/2
3	.76 1/2	.203	5.819	8
3 1/2	.92	.216	7.616	8
4	1.09	.226	9.202	8
4 1/2	1.27	.237	10.889	8
5	1.48	.247	12.642	8
6	1.92	.258	14.810	8
7	2.38	.280	19.185	8
8	2.50	.301	23.769	8
9	2.88	.277	25.000	8
10	3.45	.322	28.809	8

12	3.20	.279	32.000	8
13	3.50	.307	35.000	8
14	4.12	.365	41.132	8
15	4.63	.375	46.247	8
16	4.50	.330	45.000	8
17	5.07	.375	50.706	8
18	5.60	.375	55.824	8
19	6.10	.375	60.375	8
20	6.50	.375	64.500	8

The permissible variation in weight in 5 per cent above and 5 per cent below figures given in table above.

All weights given in pounds and all dimensions given in inches.

Unless otherwise ordered standard pipe is always furnished with threads and couplings in random lengths (16 to 20 feet).

For cut lengths, an extra charge will be made for cutting and threading.

For pipe smoothed on the inside, known as reamed and drifted, an extra charge will be made above standard pipe.

Prices For Cutting Standard Threads

Size, inches	1/4	1/2	3/4	1	1 1/4	1 1/2	2
Price each	\$0.05	\$0.05	\$0.05	\$0.05	\$0.05	\$0.06	\$0.07
Size, inches	1 1/2	2	2 1/2	3	3 1/2	4	4 1/2
Price each	.08	.10	.15	.20	.25	.35	.45
Size, inches	5	6	7	8	9	10	12
Price each	.55	.70	.85	1.00	1.25	1.50	2.50

Extra Strong and Double Extra Strong Wrought Pipe

Furnished in random lengths and with plain ends, unless otherwise specified. Random length Extra Strong and Double Extra Strong Pipe is considered to be 12 to 22 feet, but we reserve the right of supplying not exceeding 5 per cent of total order in lengths from 6 to 12 feet. For cut lengths, an extra charge will be made above random. For pipe fitted with threads and couplings and extra charge will be made above regular.

Extra Strong Wrought Pipe

Nominal Inside Diameter, Inches	Price per Foot	External Diameter, Inches	Thickness, Inches	Weight per Foot, Pounds
1/4	\$0.12	.405	.095	.314

7	6.35	7.625	5.875	63.079
8	7.25	8.625	6.875	72.424

Permissible weight variation 10 per cent above and below.

STANDARD RE-INFORCED SPIRAL PIPE

Section of Pipe with Flange Form of Coupling Welded on One End, Sleeve Coupling in Other End

The construction of reinforced steel pipe is such that the formed double lap seam has an enormous and uniform pressure resistance throughout. The reinforcing band, which follows the edge of the strip, is in fact a strengthening and stiffening rib.

There are no rivets nor lapped joints to interfere with the flow, or to allow substances to adhere and eventually clog the pipes. It therefore offers less frictional resistance than riveted pipe.

Showing Form of Interlocking Seam

It is smooth on the inside, has the reinforcing band running on the outside, its full length, and can be made any practical length. The strip is not welded or soldered onto the pipe but is interlocked in the form of a continuous seam.

Ample folds are made on both strips so that a large bearing surface, or contact is obtained at the seam. The advantages of this reinforcing band and smooth inside are appreciated by engineers who have had to contend with the frictional resistance in pipes having overlapping surfaces and projecting rivet heads.

A soft openhearth steel is used which will stand the required bending, and the steel is not weakened by being punched full of holes near the edge.

Nor is there as great a possibility of this pipe leaking as that of any riveted

construction. When winding the steel into spiral form, advantage is taken of all the tensile strength and stiffness in the material and consequently lighter gauges of pipe can be used for pressures than when other methods of construction are employed.

Tests show that it will stand close to the tensile strength limit of the steel used. The form of seam is such that the greater the internal pressure the tighter it becomes. There are four thicknesses of metal in the seam, and the pipe will withstand extreme pressure from within or without. The seam is its strongest part.

The methods of connecting lengths of this pipe is much the same as those used by makers of straight, riveted or spiral riveted pipe. Several forms of connection are used but the flanged joint is one of the best. It is easily and quickly assembled by laborers and allows of slight variations in grade of pipe line.

It is galvanized or asphalted after formation. The asphalt, or bitumite, coating is applied at high temperature and will not crack or peel off from handling or freezing.

Information Needed: In order to quote or advise intelligently as to gauges and diameters of pipe to use we should be informed as to:

- First—The purpose for which it is to be used.
- Second—The approximate working pressure or load.
- Third—If for water, flow line or pumping pressure.
- Fourth—If it is to be exposed to the air or buried underground, for blow pipe or vacuum.
- Fifth—The diameter and total number of feet required.
- Sixth—Style or kind of connections desired.
- Seventh—Diameter of flanges when pipe is to be connected up to pumps or special fittings.
- Eighth—Length of each piece preferred.

H.Channon Company Chicago

Special Pipe Cut to Order

Diagram Showing Screwed Valve and Fittings

Diagram Showing Flanged Valve and Fittings

We are equipped with improved facilities for cutting, threading and fitting all sizes of pipe to sketch.

In laying out work of this kind, great care should be taken in making sketches. All measurements should be given center to center, as shown in above diagrams. It is also necessary to know for what purpose the pipe is to be used and pressure required to stand.

Boiler Tubes

Lap Welded Steel and Charcoal Iron
Prices on Either Kind in Stock Length

Outside Diameter, Inches	Price per Foot	Thickness Nearest Birmingham Wire Gauge	Thickness, Inches	Nominal Weight per Foot, Pounds
1 1/2	\$0.27	13	.095	1.400
1 3/4	.22	13	.095	1.679
2	.20	13	.095	1.932
2 1/4	.22	13	.095	2.186

15 1/2	5.25	16.000	15.396	.302	50.632	11 1/2	2.373	16.470

The permissible variation in weight is 5 per cent above and 5 per cent below.

Furnished in random lengths, unless otherwise ordered.

All weights given in pounds. All dimensions given in inches.

Thickness of walls makes it impracticable to cut threads of coarser pitch than shown on table.

For cut lengths an extra charge will be made above random.

For galvanized or coated casing, an extra charge will be made above black.

Grey Iron Flue Plugs

To be used for plugging flues in an emergency.

For flues 2 inches.	List price each.	\$0.40
For flues 2 1/2 inches.	List price each.	.50
For flues 3 inches.	List price each.	.60
For flues 3 1/2 inches.	List price each.	.80
For flues 4 inches.	List price each.	1.00

Railing fittings are all tapped with right hand threads, except where left hand threads are indicated on the cut. We can furnish them, however, tapped all right hand at regular price. Tapped otherwise will be charged at 15 per cent additional net. Orders for railing fittings with special tapping must be accompanied by a sketch. Specially tapped fittings unreturnable.

Order by specifying number and size.
For galvanized railing fittings, add 50 per cent.

Malleable Iron Unions

Standard
Malleable
Iron Union

Standard malleable iron unions are suitable for all steam working pressures up to 125 pounds.

Railroad unions, brass to iron seat, are suitable for all steam working pressures up to 200 pounds. Examined and tested by the Underwriters' Laboratories and listed by the consulting engineers of the National Board of Fire Underwriters. They have non-corrosive ground joints, requiring no gaskets and are readily taken apart.

Dart Malleable Iron Unions

These unions have a non-corrosive seat of bronze which is fitted and ground together. Require no packing and are easily opened and replaced. In this union bronze rings are forced into recesses bored out and faced in both coupling ends of the union. The concave and convex pieces are turned and fitted together with ground joints to a true arch.

Mark Cold Drawn Steel Union

The Mark cold drawn steel union is composed of three parts—the bottom or male end, the thread or female end, and the coupling nut.

Being made of steel, and therefore having the same co-efficient of expansion as steel pipe, this union expands uniformly and does not have to be re-tightened when pipe becomes cold as in the case of malleable iron unions, nor does it become loose when pipe is hot as in the case of cast brass unions.

The Mark union is Sherardized throughout with the exception of the brass seat ring. This is done after threading, hence the threads are protected perfectly.

This union is made also in cold drawn brass.

Barco Flexible Joint

For Steam, Air, Gas and Liquids

For pipe lines conveying steam, compressed air, gas or liquids under any desired pressure. Have no ground seats or abrasive wearing parts in the joints.

The front and back gaskets are renewable and reversible, and are made of a hard-moulded non-metallic material, which is tough and has great wearing strength and when worn can be replaced at slight expense.

American and New Niagara Water Meters

3/4-inch American Meter

3/4-inch New Niagara Meter

The American meter and the New Niagara meter are of the disc type, and differ only in their outer cases, the works being alike and as shown in the sectional view on front cover.

The American meter has the main outer casing made of bronze with either a galvanized iron base or a bronze base. The galvanized iron base reduces the cost of the meter and also increases its rigidity.

The New Niagara meter has the outer casing made of a fine grade of cast iron, carefully galvanized. When a meter is frozen one-half of the outer case usually breaks, thus relieving the inner and more expensive parts from injurious strain. A new half of outer case for the 3/4 size costs but 50 cents.

The works are carefully made on the interchangeable plan from bronze composition, hard brass, hard rubber, and German silver; they are protected by an internal strainer.

The measuring chamber is of large capacity, and is fitted with an extra thick, strong hard rubber measuring disc.

The intermediate gears revolve on protected jewel bearings which reduce friction and wear, and prevent dirt from entering the gear bearings.

The flow of water through the meter is downward, which tends to flush out all sediment and sand, and thus keeps the meter in an operative and sanitary condition.

All sizes may be regulated for unusual pressures by slightly rotating the measuring chamber upon its seat and thus covering more or less of the outlet in the meter base.

American and New Niagara meters contain few parts, and are wonderfully simple and accessible for inspection and repair.

Flue Cleaning Tools

Engineer's Favorite Flue Scraper

The Engineer's Favorite is probably the most popular flue scraper on the market. It is so constructed that by turning the handle or rod, the ends or claws contract until the scraper will readily pass into the flue. Then by turning the rod in the opposite direction the claws are expanded until it fits the tube perfectly. Sizes given are the outside diameter of flue. Weights will average about 1 pound per diameter inch.

Size, inches.....	1 3/4	2	2 1/4	2 1/2	2 3/4	3	3 1/4

Price each.....	3.50	3.75	4.00	4.50	5.00	6.00	

Improved Expansion Flue Brush

The improvement of this flue brush consists of so arranging the sections that no open space extends the entire length of the brush, and thus cleans the entire inner surface of the flue each time it is pushed through. The ends and core are malleable iron and the brushes steel. Will not break with ordinary use. Made to fit all sizes of flues from 1 1/2 to 9 inches, but only sizes priced are carried in stock; other sizes being shipped direct from factory. Weights will average 3/4 pound per diameter inch.

Size, inches.....	2	2 1/4	2 1/2	2 3/4	3	3 1/4
Price each.....	\$2.00	\$2.25	\$2.50	\$2.75	\$3.00	\$3.25

Price each.....	3.50	3.75	4.00	4.50	5.00	6.00

Combination Flue Brush and Scraper

This flue cleaner combines the merits of the Engineer's Favorite Scraper and the Improved Expansion Brush, which are described above in detail. The scraper end is inserted in the flue first and the brush following leaves the tube absolutely clean. The brushes are easily replaced when worn. Made to fit all sizes of tubes from 2 to 6 inches. Sizes not priced below shipped direct from factory. Weights about 1 pound per diameter inch.

Size, inches.....	2	2 1/4	2 1/2	2 3/4	3	3 1/4

Price each.....	\$3.50	\$3.75	\$4.00	\$4.50	\$5.00	\$6.00	

The sizes given are for the outside, not inside diameter of flues

Perfection Flue Cleaner

This flue cleaner, as may be seen from the illustration consists of seven spring steel blades fastened to two malleable iron hubs, which are threaded with iron pipe thread. These steel blades are so fastened to the hubs that when they are pushed through the tube they have a shearing action on the soot and other foreign matter it is desired to remove. Made for all sizes of flues from 1 1/2 to 5 inches outside diameter. Weight, about 3/4 pounds per diameter inch.

Size, inches.....	1 3/4	2	2 1/4	2 1/2	2 3/4	3
Price each.....	\$2.00	\$2.00	\$2.25	\$2.50	\$2.75	\$3.00
Size, inches.....	3 1/2	3 3/4	4	4 1/4	4 1/2	5
Price each.....	3.25	3.50	4.00	4.50	5.00	6.00

Criss Cross Patent Flue Scraper

This scraper is conceded by most engineers to be one of the best boiler tube scrapers manufactured. It has hundreds of sharp cutting edges made from high carbon steel wire, which bear on the tube in a criss cross manner. It scrapes equally well both ways and because of its flexibility will conform to "off" size tubes. The 4 inch and larger sizes are fitted with 3/4 inch female pipe thread and the smaller sizes with 1/2 inch. Made for all size tubes, from 1 1/2 to 5 inches. Weights, about 1 pound per diameter inch.

Size, inches.....	2	2 1/4	2 1/2	2 3/4	3	3 1/4
Price each.....	\$2.00	\$2.25	\$2.50	\$2.75	\$3.00	\$3.25
Size, inches.....	3 1/2	3 3/4	4	4 1/4	4 1/2	5

Oval Spiral Fine Wire Flue Brush

Designed for cleaning hot-water and steam heaters. Size 2 1/2 inches. Approximate weight, 2 lbs. Price, each \$1.75

The Magic Steam Flue Blower

The "Magic" is a serviceable and reliable flue blower. It has been recently improved and provided with a stuffing box and valve, which prevent the escape of steam in operating, thus removing any danger of injury to operator. The price given below does not include steam hose. If steam hose is wanted it is necessary to specify it in order.

No. of Blower	Price with Clamps and Nipple	Outside Diam. of Tubes Inches	Shipping Weight Pounds
1	\$ 5.00	2 to 2 1/2	4
2	6.25	2 1/2 to 2 3/4	6
3	7.50	3 to 3 1/4	8 1/2
4	8.75	3 1/4 to 3 3/4	9
5	10.00	4 to 4 1/4	13
6	12.50	5 to 6	15

Bullock Steam Hose

For use on flue blowers we recommend our Bullock Steam Hose. In ordering be sure to state quantity wanted.

Dean Boiler Tube Cleaner

For Tubular and Water Tube Boilers, Locomotive, Arch and Superheater Tubes, Stirling Boilers, Evaporators and Condensers.

Fig. 1

The Dean Removing Scale from the Tube of a Return Tubular Boiler

Fig. 2

The Dean Removing Scale from the Tube of a Water Tube Boiler

Fig. 3

The Dean Operating in a Stirling Tube

The Dean is a pneumatic or steam operated vibrator which removes scale from either the inside or the outside of tubes of boilers, condensers or evaporators.

The Dean is operated by air or steam and cleans from 10 to 30 tubes an hour. It removes scale by the well known principle of vibration. By a series of light, rapid taps, the force of which may be regulated regardless of the pressure employed, it loosens the scale from the tube surface.

Where the scale is on the outside of the tube, it falls in showers to the bottom of the boiler.

Where it is on the inside, it is broken into small pieces and driven out by the exhaust.

In cleaning the tubes of water tube boilers, the Dean will prove superior to other means, in thoroughness of work and durability. And besides removing the scale, it will remove the hard baked soot, which cannot be removed by any other means.

The same cleaner, by changing vibrator heads, may be used in both water tube and return tubular boilers. At a small extra cost, attachments making the cleaner suitable for operating in two or more different sizes, can be furnished.

The Dean will not injure sound tubes and is the one sure device for detecting weak and burned out tubes which need repairs.

Prices

OPERATING THE DEAN WITH THE SWIVEL COUPLING

Fig. 4

"Roto" Power Boiler Tube Cleaners

Operated by Positive Balanced Motor for Air, Steam and Water

Type A. D. Roto Positive-Balanced Motor and Swing Frame Head.

Showing the rotary engine for steam or air machines. The cylinder bore is not circular—the single balanced blade fits across the bore in all positions.

Type ADB for Bent Tubes For Sterling, Maxim and Locomotive Arch Tubes. Hardened steel armor rings.

Type WD—Water Driven Machine Casing is seamless phosphor bronze tubing with steel armor rings. Shaft is chrome nickel steel with nickel bronze wheel. Has ball and roller bearings.

The six arm spider or main frame is made from solid high grade forgings and machined all over. The cutters do not change angle and cannot gouge or cut the boiler tubes. The rivetless construction allows the hardening of every piece and there are no small pins, trunnions or rivets used.

The slow wear is confined to very hard cutter bolts. A bumper stem is now provided which prevents cleaner going clear through and damaging the beading. The cleaner gets all the scale, cleans as it goes, and feeds forward almost automatically.

The Combination Drill Head

Shown at the right, is a new departure in heavy duty tube cleaning. The four blade cutter, which gets all the work and wear, is separate from the drill point and stud, which last a long time.

The separate drill point does not come in contact with the tube, so any number of cutters can be used with one drill point.

This drill head with its plain, cheap and easily ground cutters has cut the cost of maintenance.

The latest development of the engine driven boiler flue cleaner. In large power plants where hard scale forms rapidly boiler tubes can now be cleaned in about one quarter of the time formerly required—getting all of the scale without injury to the tubes.

The air or steam supply required is much less than with older models and the pressure required is also lower.

The characteristics of the motor are great strength, speed and power, with small size and weight. Direct pressure of confined air or steam, on perfectly balanced rotary parts, combines the driving force of a piston engine with a speed almost as high as a turbine and gives greater power. The engine is double-acting, self-starting and perfectly balanced.

Hardened steel armor rings and a seamless jacket thoroughly protect the motor. The hand steel rings keep it straight, round, up to size and a correct fit for the boiler tube even after long use. It cannot pass over scale or get wedged or stuck in the boiler tube.

Prices

Air or Steam Driven:		For Tubes, Ins.	Each
No. 17 AD	Hard Steel Armored	2 1/4 to 4	\$135.00
No. 18 AD	Hard Steel Armored		
Sterling		3 to 4 Bent	135.00

No. 22 WD	Hard Steel Armored		
Sterling		3 to 4 Bent	97.50
No. 23 WD	Nickel Bronze	2 to 2 3/4	75.00

Regular Equipment furnished with above machines includes: One motor, complete with hose connection and all tools. One head, drill type, and a supply of spare cutters. One head, multiple cutter type (either swing frame or fixed pin) and a full set of spare cutters, bolts, etc. For sizes smaller than 3-inch we furnish the drill head only.

Roto Swing Frame Cleaner Head

Is shown in lower left-hand corner. Its great strength and light weight are due to the double ended supports of swing frames, hinge pins and cutter bolts.

The central stem of the spider is the backbone of the structure and its concave triangular form gives great strength while allowing the use of large cutters. All other parts of the head are double supported (at both ends) from this central stem.

Wiedeke Tube Expanders

Note.—List price shows smallest inside diameter any expander passes into and what it will expand to, enabling you to select an expander with proper range regardless if used on straight tubes, swedged tubes or pipe.

Standard Roller Expander

(Patented)

Fig. 3

The rolls and mandrel of this expander are made of good tool steel and tempered. The frame is one piece, always furnishing a good bearing to the guard. It has no collar or pin to get loose or lost throwing tool out of commission. This expander will give good ordinary service.

Standard Sectional Expander

This expander is made completely of steel and hardened. It is for hand use only. Used mostly on fire boxes of thrasher engines and for repair work and gives good ordinary service. When ordering always state thickness of tube sheet; 3/8-inch plate for 3/8-inch thickness tube sheet and 1/2-inch plate for 1/2-inch thickness tube sheet carried in stock. All other plates are special.

Wiedeke Tube Cutters

Note.—Price list shows smallest inside diameter any tube cutter passes into, enabling you to select a tube cutter with proper range, regardless if used on straight tubes, swaged tubes or pipe.

Ideal Self Feed Tube Cutter

Fig. 375 For Hand Use

Fig. 375-K

Fig. 375-L

Is the only cutter upon the market that solved the problem of cutting off new steel tubes with a bevel ready for beading without cracking them, generally caused by turning them outward with a ball-faced hammer. By moving guard back, which requires a minute you can cut out old tubes inside of boiler head of water tube boiler. (Note illustrations above.) All wearing parts made of steel and tempered, making a first-class tool.

Bullock Heating Stoves

For Railroad Stations
Construction Sheds, Riggers,
Tool Houses, etc.
Neatly Designed and Serviceable

Solid Base

Caboose Leg Base

Regular Leg Base

Bullock Heating Stove with Sheet Steel Drum

Bullock Stoves are made to burn any kind of fuel—hard or soft coal, wood or natural gas, and have great heating capacity.

They are well made from high grade iron castings and all parts are carefully fitted together.

All stoves are furnished with ash pan, shaking and dumping grate, lever shelf and damper. If desired, we can also supply sheet-iron drums, water bowls and attachments for bolting to floor.

The general design of Bullock Stoves is neat and attractive, while the shape has, for many years, proved the best for all practical purposes.

They are built for—and will give—long and satisfactory service, as is testified by the thousands in use every cold day.

The Regular Pattern is for general heating, as in construction sheds, tool houses, store rooms, railway stations, etc.

The Caboose Pattern is regularly furnished with fastenings for door and ash pan and lugs for bolting to the floor of caboose. In all other respects it is similar to the regular pattern.

Buda Giant Stove

The Largest Stove Built

Made from a substantial grade of iron and well constructed throughout.

This stove radiates a tremendous amount of heat and is particularly adapted for heating roundhouses, railway stations and similar places.

Height.....60 inches
Largest inside diameter of fire pot, 26 inches
Size of pipe.....8 inches
Weight.....1100 pounds

H. Channon Company Chicago

The Channon Sand Drier

Used by Railroads, Electric Lines, Contractors, Coal Companies, etc. The stove is simple in design and massive for rough use. The wet sand is shoveled into the skirting or hopper, and as it dries, the dry sand runs through the holes in the perforated ring near the bottom. Most any kind of fuel can be used; hard or soft coal, coke or wood.

The amount of sand the stove will dry varies in proportion to the amount of moisture in the sand and the intensity of the heat in the stove.

Clear sand only can be dried, as earth or clay will bake hard, and so fail to run through the holes in the ring. The fire should be burning before the sand is put into the hopper, otherwise, the sand might bake and cake and fail to discharge itself.

Up-right Grating. We are now supplying a cast iron upright grating at extra price (see repair prices below). This grating surrounds the main body of the stove to prevent the wet sand from coming into immediate contact with the hot furnace. There is an open air space of about 1½ inches between grating and stove. The grating dries the sand more rapidly and increases the capacity considerably. **This grating is not furnished unless specially ordered.**

No.	Price	Approx. Weight pounds	Cap'ty per Day in Tons	Approx. Cap. Cu. Ft. of Sand	Extreme Height inches	Height Base to Top inches	Height of Legs inches	Size of Fire Door inches	Inside Diam. inches	Hopper at Top Diam.	Grate Diam., inches	Thick. of Castings, inches
1	\$120.00	1200	10	18½	58	48	10	10x12	23	52	22	1¼
2	76.00	700	5	8½	49½	40	10	10x12	17	40	15	¾
3	64.00	475	3	7½	48¾	38½	10	11x11	15	39	12½	¾

Capacity given is with hopper, level full—one-third can be added by heaping the sand around smoke pipe.

Showing Upright Grating

The "Union" Steel Sand Drier

A light weight portable sand stove or drier. It is shipped knocked down in four pieces; barrel, hopper, top and grate. Will dry enough sand for two to four locomotives and is a favorite with railroad contractors on account of its portability. It is also used by traction and small steam lines.

Stove is made of steel plates throughout and securely riveted together. The weight of the sand in the hopper is supported by the legs of the stove, so that should the barrel of the stove become too hot it will not buckle. Will burn either wood or coal as desired. The grate fits on lugs riveted to the legs at the bottom. Furnished with doors as shown.

The stove is 20½ inches in diameter and 36 inches high. Hopper holds about 5 bushels of sand and will dry enough sand for two to four locomotives, under ordinary conditions. Principle of operation is the same as the Channon Sand Drier.

Approximate weight 250 pounds, price each.....\$64.00

Gripwell Tires are guaranteed 3500 miles and their price is right

Sugar or Wash Kettles

The Profit Farm Boiler

The Profit Farm Boiler is a simple furnace, with a caldron which dumps, as shown by the cut. The contents can be emptied in one minute, doing away with the slow and disagreeable task of dipping it out. It is thoroughly constructed of the best cast-iron. The kettle is cast very smooth and has an extra thick bottom. Burns coal or wood. The price for wood and coal burning boilers is the same. Be sure to specify which is wanted.

Showing Dumping Process

Plain Steel Boilers

Farmers, butchers, contractors and others who want a steel boiler, good, as well as low in price, will find it in this line, which should not be confused with those of similar appearing construction, but made of stove pipe.

The jacket or shell is made from heavy sheet steel, with edges banded, and has no bottom, as the stove is intended to be used on the earth, or to be filled with brick or clay up to the bottom of the feed door. It is provided with double doors so that it can be conveniently used as a coal burner when supplied with coal fixtures.

Cross Section Showing Earth Lining

Steam Jacket Kettles and Agitator

These kettles are made of very thick metal, put together without stay bolts, have ample steam space, are packed with asbestos sheet packing, tapped for inlet and drip pipes, and unless ordered for higher pressure are tested to 75 pounds hydraulic pressure to the square inch.

The inner and outer sections are cast separately, so that the inner kettle may be replaced when worn out from use of acids or any corrosive material.

Either style may be had with any size outlet pipe, or any special attachment may be made to order.

The single action agitator illustrated below can be applied to any of the steam kettles. Simple and convenient and operated by either hand or machine power.

Approximate weight.....115 lbs

Hinged covers \$18.00 extra.

These capacities vary somewhat, as the extra thickness of metal used for the heavier steam pressures decreases the capacity slightly.

The smaller sizes of either style can be furnished coated with gray enamel at an extra cost of from \$50.00 to \$60.00.

Lead Melting Furnaces

Capacity of Kettle, 750 Pounds Lead

These furnaces are constructed of $\frac{3}{8}$ -inch boiler steel, strongly riveted and braced, with cast iron dumping and shaking grate.

Has a heavy cast iron fire pot setting inside the shell, which protects it from the heat of the fire. The grate is arranged to both dump and shake. The smoke pipe is made of heavy steel and is attached to a cast iron bonnet on the shell. The fire door is very strong, and is supplied with a draught opening. The wheels are made of steel of ample strength and revolve on steel axles. The handle is provided with a folding rest that locks in position so that the furnace always stands solid on three points. When moving the furnace, the rest folds up so that the handle may be attached to the rear of a wagon, if convenient to move in this manner. The kettle is very heavy and has an inside flange to prevent the molten lead slopping when the furnace is being moved.

A heavy steel cover is supplied without extra charge.

Weight 500 pounds, price each.....\$50.00

Lead Melting
Furnace
No. 1

Furnaces Nos. 2 and 3

This furnace is made of $\frac{3}{8}$ -inch steel, with cast iron dumping and shaking grate. The furnace rests on three heavy steel legs, and has four carrying loops riveted to shell so that it can be easily carried about by means of two pieces of pipe or iron bars.

A heavy steel cover for kettle is supplied without extra charge.

Fire Pots and Soldering Furnaces

Nos. 1 and 5 Gasoline Fire Pot

Like illustration, except that the tank is now made of heavy seamless drawn steel. It is adapted to a greater number of uses than any other. Burner is made of special generator metal and produces an ideal blue flame working perfectly in cold or windy weather. Will heat two coppers and melt a pot of lead at the same time. Capacity 7 pints.
List price each.....\$16.00

No. 5. Same as above, except with smaller tank, holding 5 pints of fuel.
List price each.....\$12.50

Nos. 10 and 20 Coil Fire Pot

These fire pots hold a gallon of fuel and are exactly the same except the way in which the air pressure is produced.

No. 20. Has a brass air pump, as shown, and No. 10 a rubber bulb.

They have a great generating power, combining marked economy of fuel consumption with the great heat produced.

Tanks are made of galvanized iron, well braced to withstand rough usage.

No. 10. With rubber bulb.....\$7.00
No. 20. With air pump.....8.00

No. 221 Kerosene Fire Pot

1 Gallon Capacity

It contains many improvements, is perfect in construction and remarkable in heat producing qualities, using but little fuel. The tank is made of heavy gauge, seamless drawn steel, with bottom and all fittings welded in, not soldered, making it extra strong and serviceable. A large automatic brass pump quickly and easily supplies all needed air pressure. The burner has a powerful generator and superheats the kerosene gas before it is burned, producing perfect combustion and a clear, blue flame, free from smoke and odor. The filler plug at the top of the tank is made with an air valve screw which releases the air pressure and extinguishes the flame. All parts are made strong and easily accessible. Weight each, 12 pounds.
Price each.....\$18.00

Superior Furnace

For Natural, Illuminating or Produced Gas

Burns about 92% of air and 8% of gas.
The fire brick keeps the heat from radiating.
Maximum capacity is four large size coppers at a time, but gives better service with only two.

List Price Each

No. 1. Single burner, with cast iron top.....\$3.00
No. 2. Double burner, with cast iron top.....4.00
No. 3. Single burner, with firebrick.....4.00
No. 4. Double burner, with firebrick.....5.00

Gasoline Fire Pot Nos. 71 and 72

Like illustration, except that the tank is now made of heavy seamless drawn steel. Noiseless, smokeless and odorless. Has a sub-flame for generator which permits heated flame to be turned very low. Superheated gas and double heating surfaces produce intensely hot blue flames, which burn from each side to center. No. 72 is similar to No. 71, but a size smaller. The burner will heat a pair of 8-pound coppers and a pot of metal at the same time.

No.	Capacity Pints	Weight, Pounds	Price, Each
71	7	15	\$16.00
72	5	14½	12.50

The "Double Blast" Fire Pot

Heats the Irons Rapidly with a Very Low Consumption of Gasoline

The blast is from the outside to the center, so that when one soldering copper is being used, both hot blasts are forced upon the one remaining.

Can be readily carried about on roofs or any place where a soldering furnace is used.

Tank is galvanized steel, 5x12 inches, with 1x10-inch brass pump. Furnace will heat two 12-pound coppers at one time.
List price each.....\$16.50

List price each.....\$2.50

Blow Torches and Brazing Forges

Gasoline Blow Torches
Nos. 31 and 32

These two blow torches are, perhaps, the most popular torches on the market.

They have no equal where intense heat is necessary and produce a perfect blue flame, indoors or out, in hard wind or extreme cold. Generating chamber superheats the gas before it is burned.

No. 32 as shown. No. 31 exactly the same, except without soldering iron hook. Capacity, 1 quart of fuel.

No. 31. Price each.....	\$9.00
No. 32. Price each.....	9.50

Gasoline Blow Torches Nos. 29 and 30

Nos. 29 and 30 are popular priced torches and while not having the improved type of burner used with the Nos. 31 and 32 torches, they are well made and serviceable. Tank is made of 18 gauge brass, reinforced. Pump is located in handle.

No. 30 has soldering iron hook; No. 29 has not.

Capacity, 1 quart.

No. 29. Price each.....	\$8.50
No. 30. Price each.....	9.00

Gasoline Blow Torches
Nos. 37 and 38

Nos. 37 and No. 38 are the best pint torches made and are exactly the same as the No. 31 and No. 32, except in the capacity of the tank.

For many purposes a small torch is much more convenient than a quart size. No. 37 with and No. 38 without soldering iron holder.

No. 37. Price each.....	\$6.00
No. 38. Price each.....	8.50

No. 10 Torch

A polished brass blow pipe or alcohol torch, possessing many exclusive features. A closely fitting cap screwed down firmly over the wick makes the tank air-tight, which positively prevents evaporation of alcohol. The blow pipe is fitted to a threaded nut, which may be run up or down to adjust it for the work in hand.

Shipping weight, each, $\frac{3}{4}$ pound.
Price each.....\$4.00

Gasoline Brazing Forge
No. 88

The two special double-jet burners with which this forge is fitted, are mounted on swivel connections at points marked S, so that flames can be turned in any direction. Fire brick shown in illustration retains the heat around the part to be brazed. The fire brick table can be raised or lowered as desired, bringing it closer to the work or lowering it away from the work. Its wide range of adjustment makes it adaptable for general work in garages, repair shops, etc. For brazing cast iron, brass and other metals, it cannot be excelled. The double-jet construction causes perfect combustion of the fuel and produces intense heat.

The tank is made of boiler steel, tested to 125 pounds pressure, holding 8 gallons of fuel. Height of forge, 55 inches, diameter 12 $\frac{1}{4}$ inches, shipping weight, 125 pounds.

No. 88. Brazing Forge.....	\$70.50
No. 230. Floor Pump.....	

Gasoline Blow Torches
Nos. 47 and 48

These torches are oblong in shape, 1 $\frac{1}{2}$ inches thick and are convenient for working in cramped places, as well as packing in the repair boxes of automobiles, etc., better than the regular round-shaped torch. No. 48 with and No. 47 without soldering iron hook. Hinged support, prevents tipping over.

Capacity, 1 pint.

No. 47. Price each.....	\$10.50
No. 48. Price each.....	11.00

No. 93 Double Jet Blow Torch

This torch has a double blast, the burners producing an intensely hot flame suitable for light brazing, annealing, tempering or drawing the temper of small tools. The burner is mounted on a swivel and can be turned in any direction.

Capacity, 1 quart.

No. 93. Price each.....	\$14.50
No. 92. Exactly same as above, except burner does not swivel, but remains upright.	
Price each.....	\$14.00

Nos. 203 and 425 Blow Torches

No. 203. "Old Reliable" Gasoline Torch has been on the market for many years and is favorably known to thousands of mechanics. Capacity, 1 qt. Price each.....\$8.50

No. 425. Is a comparatively new torch using either gasoline or kerosene, vaporizing the latter perfectly. Capacity, 1 quart.

No. 203. Price each.....	\$10.50
No. 425. Price each.....	11.00

Note:—Nos. 203 and 425 torches are furnished with a detachable soldering iron hook.

Gasoline Brazing Forge
No. 105

Double Jet

This forge will produce an exceptionally high degree of heat with small burners. The double jet construction causes perfect combustion and consequently the maximum degree of heat is obtained with the minimum consumption of fuel. Flames are regulated by means of valves. With the burner valves turned on full, the flame is much larger and can be used for brazing heavier work in cast iron, brass and other metals.

Size of flame at burner, 1 $\frac{1}{4}$ inches. Length of flame, 10 inches. Consumption about 2 quarts. Weight about 74 pounds.

Style	Cap. gals.	Hght. inches	Diam. inches	Price Each
No. 105	8	50	12 $\frac{1}{4}$	\$63.00

Pipe Joint
Lead Melting Machine

Designed especially for melting lead in pipe joints of water and gas mains or where it is desirable to bring the flame to the work. Burner is made of special bronze metal, attached to a three-foot iron pipe with handle. Generator produces a perfect blue flame of about 2,800 degrees Fahrenheit. A blow torch is furnished with each machine for generating the burner. Six feet of special oil hose accompanies each machine. Size of flame at burner, 2 inches; length about 2 inches; consumption about 3 quarts per hour; capacity 8 gallons; height 27 inches; diameter 12 $\frac{1}{4}$ inches; weight 90 pounds.

No. 82. For gasoline.....	\$107.00
No. 82A. For kerosene.....	116.50

Foot Blowers

Nos. 9, 9A or 9B

The best foot blower ever constructed for laboratory purposes. Of excellent workmanship and the best material obtainable. We guarantee them to be as durable as any article of the kind made.

A rubber disk forms the air reservoir and equalizes the pressure by its elasticity. By increasing the number of disks, a greater air pressure is obtained. Can be operated anywhere, even upon a dust heap, without picking up dust or lint.

No. 10 is mounted upon legs, the blowers being reversed so as to bring the air reservoir below instead of above. This obviates the risk of injury to the rubber disk or its containing net, by dropping tools or corrosive liquids upon them.

No. 10B has detachable legs.

Nos. 10, 10A or 10B

No.	No. of Disks	Size Boards	Diameter Air Reservoir	Pressure of Blast per Inch Pounds	Cu. Ft. of Air per Hour	Price Each

Extra nets. Each \$0.35

No. 8C Brazing Blow Pipe

Requires $\frac{3}{8}$ -inch gas supply pipe and tap $\frac{1}{8}$ -inch air jet, with stop-cocks. Operate with No. 9A or No. 10A foot blower. Can be supplied to burn natural gas or gasoline gas, if desired, without extra charge. Furnished for illuminating gas unless otherwise specified.

Price each \$3.00

No. 8E Brazing Blow Pipe

$\frac{1}{2}$ -inch air jet, $\frac{1}{2}$ -inch gas opening, with stop-cocks. Requires $\frac{1}{2}$ -inch gas supply pipe and tap. For illuminating gas unless otherwise specified. Adapted to burn natural gas or gasoline gas without extra charge.

Price each \$4.25

No. 8F Brazing Blow Pipe

$\frac{1}{2}$ -inch air jet, 1-inch gas opening, gas nozzle of steel tubing, with stop-cocks. Requires $\frac{1}{2}$ -inch gas supply pipe and tap. For illuminating gas only. Stop-cocks are both under perfect control of the thumb of the hand holding blowpipe. Nos. 8E and 8F require Nos. 9B and 10B foot blower.

Price each \$5.25

No. 8G Brazing Blow Pipe

For natural gas, non-extinguishable. Made of iron throughout, except brass cocks. Will work equally well with illuminating gas. Power and capacity same as No. 8F.

Price each \$5.00

Hauck Portable Kerosene Burner

Hand Pump Type

No Compressed Air Required

For kerosene only; having a quick acting hand air pump built inside the tank. It was designed for field and shop work where compressed air is not available or convenient for use. The flame is intense and easily regulated. The burner operates approximately five hours with a few strokes of pumping.

Stands as shown, holding above burner, are furnished when ordered.

Hauck Portable Kerosene Lead Melting Furnace

The standard type furnace, made entirely of steel and iron, with a cast iron melting pot and bar. It is equipped with a Hauck burner of the latest improved type attached to the furnace shell and 10-gallon capacity seamless drawn steel tank, equipped with a quick acting and powerful hand air pump; also pressure gauge and necessary valves.

Only a few strokes are necessary to obtain the required pressure. The burner operates approximately five hours with a few strokes of pumping.

The furnace is well balanced and easily portable. Note the wide rims on wheels.

450 pounds of lead can be melted within 20 minutes and kept in molten condition at a few cents per hour. Additions of new lead will melt instantly.

The oil tank and burner are securely attached to the furnace and always ready for immediate use. Made in three sizes.

Also furnaces of the No. 122 type, mounted on three legs, furnished with a bracket to hold any type of portable burner.

No.	Capacity of Pot, Pounds	Oil Consumption per Hour, Gallons	Price
21	200	1	\$100.00
22	450	$1\frac{1}{2}$	113.50
23	850	2	127.00

Portable Kerosene Lead Melting Furnace

Hauck Combination Melting Furnace and Portable Heater

Hauck portable burner used in connection with a melting furnace; 200 pounds of babbitt metal melted in fifteen minutes and the molten metal kept at a proper temperature at little cost.

The burner may be detached from furnace and used for numerous other heating requirements.

Special furnaces and burners for melting brass, copper, iron, aluminum, bearing metal, lead, etc.

Price with No. 7 burner..... \$ 93.50

Price with No. 8 burner..... 107.00

Extra burner with base like No. 131 without tank, for attaching to above furnaces, \$33.50 additional.

Channon Oxy-Acetylene Supplies

No. 2 Outfit

This apparatus is designed for use in large welding shops, for general repairs in mills, factories, large foundries, boiler shops, railroad shops, etc. Its capacity for welding and cutting is exceptional. The welding torch will weld up to 1½ inch thickness of steel and 4 inch thickness of cast iron.

List of Equipment

One No. 2 torch nicked throughout with ten copper tips. Torch is 22 inches long and weighs 30 ounces.

One No. 2 long arm oxygen regulating pressure valve nicked throughout and fitted with a 3,000 pound safety back, tool steel spring gauge to show the tank pressure and a 150 pound line gauge to show the working pressure. Also a needle valve and hose connection outlet from ¼ to ½-inch hose as specified.

One No. 2 long arm acetylene regulating pressure valve, gun metal finish, fitted with a 300-pound tank pressure gauge and 50-pound line pressure gauge, needle valve outlet with ¼ to ½-inch hose connections are supplied as specified.

NOTE: This valve contains a Silver Bronze Diaphragm, as required by the U. S. Bureau of Safety Transportation of Explosives.

10 feet white high-pressure hose for oxygen. 10 feet black high-pressure hose for acetylene. 1 large nicked wrench. 1 small nicked wrench. 1 pair welder's goggles, large oval lenses of amber olive glass and metal gauze spark protector. 1 carbon removing torch. 2 instruction books. 1 steel shipping case. 10 pounds assorted cast iron welding rod (¾ to 1½ inch diameter). 10 pounds ¼ to ½-inch low carbon steel welding rod. 5 pounds ¼-inch to ¾-inch Norway Iron Welding Rod. Three pounds cast bronze welding rod (for brass or bronze). 2 pounds ½ and ¾-inch cast aluminum welding rods. 1 pound cast manganese bronze rods (for malleable iron brazing, etc.). 1 pound ¼ and ½-inch cast copper welding rods. 2 pounds cast iron flux. 1 pound brass and copper flux. 3 bottles (12 oz.) aluminum flux.

No. 2 Channon torch (10 tips) \$ 25.00
No. 2 Channon outfit, complete with cutting attach. 100.00
No. 2 Channon outfit, without cutting attach. 85.00

No. 1 Torch and 6 Tips

This apparatus is designed for use in garages, repair shops, small mills, machine shops, foundries, etc. It will weld any steel job up to 5/8-inch thick and cast iron 1½-inches thick if pre-heated. Will do excellent work on engine parts, frames, cases, dies, tools, forgings, castings, brazings, etc.

List of Equipment

One No. 1 torch nicked throughout with six copper tips. Torch is 19 inches long, weighs 30 ounces and will be supplied in 90, 50 or 15 degree heads as ordered.

One No. 1 oxygen regulating pressure valve nicked throughout with one 50-pound nicked line pressure gauge or one 150-pound gauge if ordered with cutting attachment (see below).

One No. 1 acetylene regulating pressure valve, gun metal finish with one 50-pound black line gauge.

10 feet white 150-pound high-pressure hose. 10 feet black 150-pound high-pressure hose. 1 9-inch nicked monkey wrench. 1 7-inch nicked monkey wrench. 1 set olive green oval welder's goggles with gauze face protector. 1 carbon removing torch. 2 instruction books. 1 steel shipping case. 5 pounds beryllium C. I. welding rod. 5 pounds low carbon steel welding rod. 2 pounds Norway iron welding rod. 1 pound cast bronze rod (for brass or bronze welding). 1 pound cast aluminum welding rod. 1 stick aluminum solder. 2 pounds cast iron flux. 1 pound brass and copper flux. 1 bottle aluminum flux.

No. 1 Channon torch (6 tips) \$20.00
No. 1 Channon outfit, complete 50.00

Channon No. 0 Oxy-Acetylene Welding Outfit

For garages, small machine shops, repair shops, etc., where cast iron welds will not be over ½ inch thick.

List of Equipment

1 pressure welding torch, nickel plated throughout with 5 tips. 1 oxygen pressure regulator with 50-pound line gauge. 1 acetylene pressure regulator with 50-pound line gauge. 18 feet high pressure welding hose with clamps. Steel carrying case and 2 instruction books. 1 nickel plated wrench. 1 pair welder's goggles.

No. 0 Channon torch (5 tips) \$15.00

Price each, complete.....\$10.00

The Neway Bottom Draw Melting Furnace

Burns Coal, Coke or Wood

These furnaces are thoroughly practical in design and are especially durable in construction. All metal parts are of heavy cast iron and steel (not sheet iron) and the lining is a superior quality of fire brick with an insulated backing of asbestos.

The Melting Pot has an internal automatic and adjustable valve device whereby the metal is drawn directly from the bottom of the pot where it is always clean and pure.

It saves time and material because the surface of the metal is never disturbed.

The Valve Stem is of the same material as the melting pot, insuring the same expansion and contraction. By an adjustable locking device it is regulated to any wear that may occur at stem or seat.

The Furnace Hood eliminates all fumes and smoke and is a very important factor in keeping the metal at uniform temperature, and protecting it from the air. Contact with cold air causes oxidation and every pound of oxidation is a pound of loss in material.

Fig. 1 For Burning Coal, Wood or Coke

Shows the furnace equipped with iron pot for making and refining all kinds of babbitt metal, solder and all other white metal mixtures.

Fig. 2 shows the furnace equipped for burning gas.

The iron melting pot may be removed and a crucible inserted for making bronzes,

brasses, etc. To do this it is only necessary to remove the two cap screws which fasten hood to top plate. Remove the hood and substitute a cover plate furnished for that purpose.

Specifications

Capacity melting pot, 500 pounds. Daily capacity, 5000 pounds. Outside diameter, 22 inches. Height over all, 40 inches. Height to top of rim, 31 inches. From floor to draw pipe, 20 inches. Diameter of melting pot, 15 inches. Height, 11 inches. Made for all size crucibles from 0 to 45 inches. Weight complete, 600 pounds.

Prices

One ladle stand, one metal mixer and one metal fluxer, as shown, furnished with each furnace.

Furnace complete for burning coal, coke or wood. Price \$134.00

Furnace complete for burning coal, coke, wood or gas. Price \$167.00

The Neway Bottom Pour Self Skimming Ladles

When pouring from ordinary ladles it is always necessary to first skim the impurities from the surface. With these ladles the metal is poured from the bottom.

The impurities cannot enter the port, but remain on the surface as a protection against oxidation and cooling.

The Channon Tilting Cupola Furnace

For Small Foundries and Technical Schools

The Channon tilting cupola furnace was designed for small foundries where it is desired to run off small heats with the minimum of expense and labor. With one of these installed, it is possible for small manufacturers to economically make their own castings, and thus save time and trouble by getting castings when they are needed.

It is invaluable in large foundries for running test or special heats. Many are now in use in Technical Schools, where they have proven themselves indispensable.

It is built in two sizes—16-inch and 18-inch, inside the lining with a melting capacity of about 1500 and 2000 pounds per hour, respectively.

We can furnish the cupola only, or complete with platform as illustrated.

It is impossible to list a price in this catalogue, as conditions differ. When writing for price, give drawing, showing floor plan, openings, height of ceiling, and what is above if more than a one-story building.

It is better to run a straight stack, but it is possible to turn into a flue, if flue is sufficiently large.

The Channon tilting Cupola can be installed under almost any conditions, but we must know the conditions before quoting.

If interested, write for special booklet.

Ladles less than 2,000 lbs. capacity made without basket. Ladles 2,000 lbs. capacity and over made with basket. In sizes above 8,000 lbs. capacity bail is made with channel cross-bars.

No. 1 High Pressure Burner

at boiler pressure of 80 pounds or over (the higher and dryer the better) or with compressed air pressures of 5 pounds per square inch or over.

The steam or compressed air is employed principally for atomizing the oil. Most of the air to support combustion is induced from the atmosphere by, but regulated independently of, the blast from the burner.

The best results are obtained when these burners are installed with the burner plates illustrated below—and a combustion chamber set with the special tiles, also shown, properly adapted to the operating requirements. By means of the burner plates provision is made to light, and to observe the condition of the fire without cooling the combustion chamber, and for regulating the supply of induced air without exposing the hot brick work to the cold air after the fire is shut off, as where large ungoverned burner ports are employed.

The plates also maintain the correct position and alignment of burners and with the proper combination of tiles insure efficient and economical combustion of oil.

We carry hundreds of sizes and styles of tile to meet all requirements, and designed to lay with ordinary fire brick. The proper tile to employ being governed by the construction of furnace and operating conditions.

No. 1 burner illustrated above, is most generally used, and covers a wide range, from small tool forges to the largest annealing and heating furnaces. **No. 2** is the same excepting that the valve arrangement is different and the discharge is at right angles. It is generally used where the location is not very accessible and with extension stems to facilitate operation. Shipping weight, Nos. 1 and 2 Burners, 10 pounds.

No. 4 low pressure oil burner is for operation with an air blast from positive pressure blower at from 8 ounces to 2 pounds, depending upon character of furnace and work. It is an excellent burner for high temperatures and welding heat.

The burner includes valves, union and stop cock as illustrated. All parts are accessible and interchangeable. Shipping weight, 20 pounds.

Fig 8. Burner Plate

Rockwell Oil Burners

The combustion of oil is governed by the same principles as that of gas, coal or other fuel and unless the supply of air is proportioned to the quantity of oil consumed improper combustion results whether the amount of air is insufficient or excessive.

As the supply of oil varies from the time of starting until the furnace is in operating condition a corresponding variation in the air supply should be effected—and unless the supply of air induced by the burner as well as that supplied under pressure is proportioned to the full input, a waste of fuel from poor combustion or of material from improper temperature in the furnace chamber results.

The great economy and efficiency of the Rockwell burners is due to the accuracy with which the air supply may be proportioned and regulated.

Oil burners Nos. 1 and 2 are designed for operation with dry steam

No. 4 Low Pressure Burner

Special connecting and shut off valves are provided, independent of the regulating valves for cleaning, adjusting or removing burners without disturbing the operation of others on the same line.

All fittings are of hard brass. Union connections with ground joints, adjustable clamps and brackets are supplied for attaching burners, as shown by Fig. 8.

Pipe connections are $\frac{1}{2}$ -inch, made large for sturdy construction.

Union or Family Scales

A good general scale, combining capacity and fine weighing in one. Furnished with single or double beam, scoop or small platform.

Capacity 240 pounds by $\frac{1}{4}$ -pound marks on large platform or 30 pounds by $\frac{1}{2}$ ounces on scoops or small platform. Weights, $1\frac{1}{2}$ to 80 pounds. Size of large platform, $10\frac{1}{2} \times 13\frac{1}{2}$ inches.

No.	Equipment	Price Each
500	Single beam, tin scoop	\$14.00
502	Single beam, brass scoop	15.00
504	Double beam, tin scoop	15.00

 No. 616. Capacity, 20 pounds. Price each... 18.00

H. Channon Company Chicago

Express Package Scale

Full capacity on beam. Extensively used by express companies and others for weighing packages. Upper bar marked 5 pounds by 1 ounce. Lower bar, 1 pound to 50 pounds. Capacity, 55 pounds by 1 ounce. Platform, 10½ x 12 inches. No. 532. Price, each.....\$15.00

Boston Grocer Scales

A handsomely finished scale, designed to bring beam opposite the eye where it can be easily read. Upper bar is graduated 11 pounds by 1 ounce; lower bar, 50 pounds by ½-pound marks, with weights, 1½ pound per 100. Platform, 10½ x 14½ inches. Double brass beam nickel-plated. Capacity, 250 pounds.

No.		Price, Each
518	With heavy tin scoop.....	\$24.00
520	With heavy brass scoop.....	25.00
521	With enameled platform.....	27.00
522	With seamless tin scoop.....	25.00
524	With seamless brass scoop.....	27.00

Portable Platform Scale

Suitable for weighing merchandise of any line. Scales of 1000 pounds capacity and larger have pillar braced with iron. Beams graduated by ¼ pound marks on scales having 400 and 600 pound capacity; larger sizes, 100 pounds by ½ pound divisions. Weights, 1 to 100 pounds.

These scales are made of best material throughout, with well tempered steel bearings and pivots where both strength and extreme hardness are needed.

Brass Beam, Sliding Poise with Set Screw, Hardwood Platform, Panel Board.

1200 Ex	1200 x ½	17½ x 26	37.50
1500 Ex	1500 x ½	18 x 26	46.00
1800 Ex	1800 x ½	20 x 28	50.00

Sometimes furnished with double beam at \$2.25 net extra.

Platform Counting Scale

This machine is designed for weighing small articles which are sold by the pound and piece, but can also be used as a regular scale by using the sliding poises and weights. We make any scale shown above in two ratios as selected—1 to 200 and 1 to 50 to count thousands, or 1 to 144 and 1 to 48 to count dozens, or 1 to 100 and 1 to 20 to count hundreds.

For Counting Small Articles Like Nuts, Nails, Screws, Bolts, Etc.

To estimate price, add \$20.00 to list price of 1100 Series Portable Platform Scales in size wanted.

Portable Platform Scales

Constructed Entirely of Metal, Brass Beam, Sliding Poise and Set Screw.

Beams graduated 50 pounds by $\frac{1}{4}$ -pound divisions on scales 400 and 600 pounds capacity; on larger sizes, 100 pounds by $\frac{1}{2}$ -pound divisions. Weights, 1 to 100 pounds.

Scales of 1,000 pounds capacity and larger have pillar braced.

No.	Capacity Pounds	Platform Inches	Price Each
1117.....	2,500 x $\frac{1}{2}$	26 x 34	\$95.00

1131.....	400 x $\frac{1}{2}$	15 x 21	31.00

Portable Platform Scales

With Wheels and Drop Lever Brass Beam and Sliding Poise.

By means of drop lever all bearings are relieved from wear and danger of breaking the scale mechanism when loading or removing heavy articles from platform.

Beams have set screws in poises, and graduations same as corresponding sizes of regular portable scales.

Beams graduated 50 pounds by $\frac{1}{4}$ lb. divisions on scales 400 and 600 pounds capacity, and on larger sizes 100 pounds by $\frac{1}{2}$ -pound divisions. Weights 1 to 100 pounds.

Scales 1,000 pounds and larger have pillar brace.

Dairy Scales

With Double Brass Beam and Sliding Poises.

This scale adapted for weighing cans of milk, having a double beam, so that the tare of can is taken by poise on one bar of beam, and the net amount can be ascertained on the other bar.

Weights are 1 pound per 100. Set screw in lower poise.

No.	Capacity Pounds	Platform Inches	Price Each

Ice scales with double beam 800x1 and 200x1 pound. Extra, \$27.00.

Extra Heavy Portable Foundry Scales

For general foundry, factory and mill use. Brass beam with sliding poise and set screw and graduated 100 pounds by 1/2-pound divisions.

Mounted on wheels 9 1/2 in. in diameter, making platform at a convenient height.

Also furnished with drop lever for relieving the bearings when load is being placed on platform.

Face of pillar protected part way with iron plate and pillar braced.

With Wheels

No.	Capacity Pounds	Platform Inches	Price Each

Dormant Warehouse Scales

With Two Tall Iron Pillar Outfit

Double brass beam, sliding poise and lower poise with set screw. Double beam is convenient to take tare of trucks or cases. Weights, 1/2 pound to 100 pounds.

These scales same as preceding, but are fitted with two tall iron pillars.

When ordered with scale, a full capacity beam to dispense with loose weights will be furnished at an additional list price of \$20.00.

Furnished with set of marginal irons to protect wood floor surrounding platform.

Warehouse and Factory Scales Improved Loop Bearing Pattern

Many superior points of merit are found in our loop bearing pattern scales—simplicity of construction, greater accuracy and durability in manner of supporting levers and load. Sizes of platforms of the scales may be varied somewhat from given dimensions without increasing cost. Fifteen-ton scales have full capacity beam.

Prices are exclusive of lumber and foundation, which are furnished by the purchaser. Beam boxes extra, \$25.00.

No.	Cap. Tons	Size of Platform	Distance from Edge of Platform to Beam Rod	Price Single Beam	Price Double Beam
6170	15	7x5 ft. 1 1/2 in.	2 ft. 5 1/4 in.	\$350.00	\$365.00

Quotations on scales of any size for every purpose upon application.

Pitless Wagon Scales

Erected in a steel frame with wood platform. Self-contained, requiring no pit. For accuracy, strength and durability these scales cannot be excelled. Always sold complete with steel frame and beam box ready to place in position. Purchaser furnishes lumber for platform and supports.

Compound, instead of double beam, extra, \$15.00.

No.	Capacity, Tons	Size of Platform, Feet	Depth, Inches	Price Double Beam

7027	2	96x72	320.00	330.00

Suspension Crane Scales

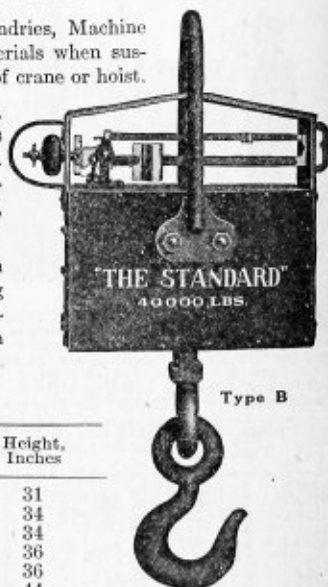

Type A

Used largely by Steel Works, Foundries, Machine Shops, etc., for weighing heavy materials when suspended. Can be used with any kind of crane or hoist.

Working parts contain no springs, but built upon a leverage principle as used by platform and wagon scales. A strong steel case encloses the working parts, protecting them from dirt, wet and breakage.

The entire load can be weighed on beam without the use of loose weights. Having no springs, these scales may be used near furnaces for weighing hot ingots. "Height" is from top loop to bottom hook.

Type B

No.	Price Each F. O. B. Factory	Capacity, Pounds	Type	Height, Inches

SCS40	490.00	40000x5	B	44

Railroad Track Scales

Our latest extra heavy iron frame "The Standard" track scales are everywhere known as durable, accurate and well adapted for railway use and large industries.

The standard gauge of track is 4 feet 8½ inches, and will be understood to be desired unless other gauge is specified.

They may be installed with steel construction instead of timber, especially suitable for use in hot climates and other localities.

These scales are usually fitted with improved single beam, but double, triple or gridiron beams, which are the various types

Prices do not include foundation or material for framing scales, which are furnished by purchaser.

Short iron pillar beam fixtures, or beam box furnished when desired at extra price.

Railroad scales furnished to be built with third or dead rail when so ordered, at extra price for metal supports, upon application.

For Railroad Track and Wagon Scales

The recording beam shown in this illustration is the most satisfactory device yet invented for obtaining a correct record of weights. Its simplicity of construction, absolute accuracy of record of weight at one operation cannot be surpassed. Movement is not affected by wear, dirt or weather.

Correct weight can be had in less time than by reading beam, and record obtained can be referred to at any time, which is valuable evidence in case of disputed weights.

Our beam with attachment can be applied to any make of scales.

Recording Ticket

Cut shows ticket (reduced size) for 100-ton full capacity beam for railroad track scales. Ticket is placed before beam in receiver, and when correct position of poise is attained a touch of the ticket holder will make a hole in ticket, indicating number of pounds in unmistakable manner. The tickets for other scales are arranged upon the same principle, differing only in size and capacity.

Standard Motor Truck Scales

Note the Load on Rear Axle

The use of Auto Trucks for carrying heavy loads has created a demand for a much heavier type of scale than wagon scales. This is necessary for accurate weighing and to guard against accidents which may occur on the scales of insufficient capacity.

These scales are of railroad type, having self-aligning pendulum bearings with big adjustment; self-centering blocks on top of pivot and at supporting point on the pendulum. Length of pendulum is sufficient to be effective in absorbing shocks, thrusts and deflections, therefore, oscillation on the knife edges is practically nothing. The yokes that bear upon the bearing links are braced laterally.

The "Standard" Wagon Scale is not suitable for weighing auto trucks, due to the fact that about 70% of the load on a motor truck is carried on the rear axle, which will usually crush an ordinary wagon scale, which is designed for loads distributed equally.

Full capacity Double Beam. Tare bar, 6 tons.

Standard Automatic Dial Scales

Constructed entirely of metal, self-contained and ready to place on foundation.

The bearing surfaces in dial are rolling in links which eliminates practically all wear and jar, an essential in automatic scales.

Fig. G1400 The Mundy Perfect Friction Drum

The "Mundy" Hoisting Engine The Original Friction Drum Hoist

For Forty Years the Standard of All
Hoisting Machines
We are the Western Selling Agents
Large Stock Carried in Chicago

More good material, honest and skillful workmanship goes into the manufacture of Mundy Engines than into any other—none excepted.

The Mundy Patent Cone Friction Drum has proven itself to be the best device ever applied to a hoisting engine, to which thousands of bridge builders, contractors and mining companies and others in all parts of the world are ready to testify.

Referring to the line illustration, the drum, loose or free on the shaft, is clutched or thrown into engagement, by means of a hand lever and screw thrust, forcing the drum laterally along the shaft against the wooden friction blocks attached to the gear. When the hand lever is released the drum is forced back and off the friction by the heavy recoil spring.

The essential features of the Mundy Single Cone Friction are low angle (18 degrees) and large area, ease and rapidity of taking and releasing friction, freedom from liability to stick, and a perfect control by the operator, of the required intensity of pressure, under the varying conditions of load and speed, so that the drum may be made to revolve quickly or slowly, with the engine running at the same speed, hold fast and revolve with the shaft, or go slower than the shaft, or let go and turn, either fast or slow, in a direction contrary to the revolution of the shaft, thus giving the operator, by the sense of feeling conveyed by the hand lever, absolute knowledge of what is needed to perfectly control the load. This friction has survived hundreds of other forms and is still the most popular today, the hardwood friction blocks take end wear across the grain, will last a long time and are easily replaceable and the simplest to adjust.

Every part entering into the construction is made of the best material obtainable. The steam cylinders have large ports, thereby making the engines very quick and saving back pressure in the exhaust. The pistons are fitted with self-adjusting packing rings, always perfectly tight and requiring no attention. A plain slide valve is used that can be adjusted or set by any engineer. The guides and cross-heads are of the locomotive type, having large wearing surface and from iron-cut pattern and are impossible to get out of line. The gears are cast cast steel. All terms and are perfectly true, the pinions are made of shafts are large and the bearings generous in size.

Fig. G1401 The well known Mundy "One-Piece" Engine Side Frame

The engines are all of the long-stroke type giving greater leverage, slower engine speeds, greater fuel economy, less wear and consequently longer life.

All Mundy hoists have the "one-piece" side frames—the brackets or stands, for carrying the drums and main shaft, are cast solid with the lower frame, doing away with joints and bolts.

The lower halves of the boxes are cast integral with the stands and frame.

The boilers are easy steamers and have the Jerrold Patent Tube Setting in the top heads which are extra heavy and warranted not to leak even if the tubes should be fired to a red-hot heat.

The "Mundy" has the record for long service in constant use. It is pre-eminently "The Contractors' Hoist." It will stand more use and abuse and it requires fewer repairs than any engine made. We show only a few standard styles in this book.

Send for complete special catalog.

Standard Engine for Railway, Contractors and Quarry Use

This is the Most Popular Style of Contractors Hoist and the Best Selling Sizes are Nos. 232 to 242, Inclusive.

Fig. G 1402

Mundy's Improved double cylinder, double patent friction drum hoisting engine, with foot brakes, ratchets and pawls, two winch heads, boiler and all fixtures complete and ready to run, including foot brakes for each drum.

All Boilers Have "Jerrold" Patent Leakless Tube Setting in Top Head.

Every engine has winch head on the end of each drum shaft for hauling the machine, piles, timber, etc. When used for operating a boom derrick, one drum is used for raising the load, and the other for raising or lowering the boom. When pile-driving, one drum is used for running the hammer and the other for hoisting the piles or timbers. The ratchet and pawl on the end of the drum is a device for holding the weight with one drum while the boom is being lowered or swung to its desired position.

This engine has been adopted by the United States Government engineers, the largest contractors and iron bridge builders in the United States, and many railroad companies, as the best standard hoisting engine made.

In pile-driving a 6½x12 or 7¼x10 engine with a 2500-pound hammer will strike from 15 to 25 blows per minute, running the hammer from 12 to 25 feet high every blow; and with a 7x12 engine with a 3000-pound hammer will strike the same number of blows.

Furnished with link-reversing motion when especially ordered.
Can also be made with clutched winch heads.

"Mundy" Hoisting Engines Without Boiler

Double Cylinder Single Friction Drum Hoist

Double Cylinders, Double
Patent Friction Drums, with
Ratchets and Pawls, Two
Winch Heads and All
Fixtures Complete
Including Foot Brakes
For Each Drum

This type of engine is designed for operating derricks and for general hoisting purposes. It is especially adapted for use in quarries, or tunnel work, or excavations where it is desirable to use many of these engines along a line of work, taking the steam or compressed air from one stationary plant. All Mundy engines will work under compressed air pressure equally as well as under steam pressure. It is also well adapted for use on structural work, trestle work, and places where it is necessary to locate the engine at a point not convenient for the location of a boiler. This engine furnished with clutched winches in place of the fixed winches when desired. We always furnish foot brakes unless otherwise ordered.

Double Cylinders Single Friction Drum Hoist

Suitable for general hoisting or pile driving. A winch or nigger head is keyed to the drum shaft for hoisting piles while the drum is used for hammer line. Furnished with drum ratchets and pawl, foot brake and fixtures complete.

"Mundy" Improved Derrick Swinging Engine

Double Cylinders, Double Patent Friction Drums with Foot Brakes, Ratchets and Pawls, Two Winch Heads and Wright's Patent Reversing Friction Swinging Drum, Boiler and all Fixtures Complete and Ready to Run.

Fig. G1403

This engine is especially adapted for operating and swinging a boom derrick; the top drum being used for hoisting the load, the second drum for raising and lowering the boom, and the swinging drum, which is connected by wire rope to bull wheel of derrick, swings the mast and boom.

The derrick swinging attachment is of new design and construction. The drum works free on the shaft, and has a friction at each end. Located on the same shaft at each end of the drum, are friction gears, rotating in opposite directions. The drum is arranged with an adjustment in the center for lengthening it to compensate for the wear of the frictions. The construction for operating the drum is so arranged that it is engaged with either friction by the movement of one lever. The drum, when at rest, is disengaged from both frictions, and for swinging the derrick is thrown in to either the forward or back motion friction, as may be required. The pulling speed of this drum is of a proportion approximating 1-5 to 1-6 of the speed of the hoisting rope, for swinging the derrick with the load and has an increased proportion of approximately one-third the speed of the pulling drums for returning the empty derrick, thus making a saving of time. All of the parts of this attachment are made extra heavy and strong with steel gearing, and being compound geared will swing a derrick under any circumstances.

Can also be furnished with single friction drum.

"Mundy" Bridge-Builders' and Erectors' Engine

With Four Independent Clutch Spools

Double Cylinder, Double Patent Friction Drum Hoisting Engine with Four Independent Clutch Spools, Ratchets, Pawls, Boiler and all Fixtures Complete, Including Foot Brakes for Each Drum.

Fig. C1405

This engine is the favorite type for bridge building, erecting, pile driving and contractor's use.

This engine is especially constructed as a combination engine for use where it is desirable to handle derricks with friction drums and other material by use of winches with free end lines. All winches are independent, working free on shafts and are engaged with clutches, also having ratchets and pawls.

The levers for operating the clutches are provided with racks and latches for holding the clutches in position when engaged with the winches or disengaged. The shafts are made extra large to withstand heavy strains.

No. 424 is the popular size.

"Mundy" Double Cylinder, Double Friction Drum Hoisting Engine and Boiler

With Extension Winch Shaft and Four Clutch Winches, Especially Adapted for Architectural Iron Work, Construction and Bridge Erecting

For Railroad Derrick Cars

This engine is constructed especially for bridge erecting and structural work where a great amount of handling is done with winches and free end lines. Each winch works independently, with clutches and shifting apparatus; the frames being extended and provided with a very heavy shaft for hoisting or hauling of heavy loads. It is a very complete engine for general contracting work. All the drums and winches have shrouded ratchets, and are provided with pawls, for holding the load when the frictions or clutches are thrown out. The extension shaft with the frames can be made detachable if desired. Foot brakes included unless otherwise ordered.

Propelling attachment for derrick car is usually attached to front shaft.

"Mundy" Double Cylinder, Triple Tandem Friction Drum Hoisting Engine,

With Two Winch Heads, Ratchets and Pawls, Foot Brakes, Boiler and all Fixtures Complete.

This engine is constructed with three friction drums, all provided with pawls and ratchets, each working independently. It is specially designed for operating a derrick, or handling a clamshell, or orange-peel bucket where it is desirable to use three lines; one drum being used to hoist and lower the boom, using the two remaining drums for operating the bucket. It can also be used for many other purposes where it is necessary to operate three hoisting lines.

There are two large winches fixed to the outer end of the drum shafts. We also furnish this engine with independent clutch winches in place of fixed winches, when wanted.

Independent swinging engines, listed elsewhere, usually furnished with this outfit.

"Mundy" Double Cylinder, Triple Tandem Friction Drum Engine

With Wright's Patent Derrick Swinging Drum Boiler and all Fixtures Complete, Ready to Run

FOR OPERATING GRAB BUCKET DERRICKS

Standard engine for operating Clam-shell or Orange-peel Buckets, two drums are required for operating the bucket and one for raising and lowering the boom and the front or swinging drum for slewing the boom and mast.

The two upper drums are provided with fixed winch heads on the outer ends of the drum shafts. Drums have ratchets and pawls and foot brakes.

All levers may be banked in one quadrant, if so desired.

Mundy Logging Engines

Designed especially for logging purposes. Experience of many years has taught that these machines are the best and most economical in the long run.

The boilers are extra large on all Mundy Engines for this purpose, thereby steaming freely with a wood fire. The engines are made from new patterns throughout, with extra large steam and exhaust ports, thereby quickly giving the largest amount of power from the carefully selected sizes of the cylinders. The lower hoist drum is larger than the upper one and will hold a large amount of wire rope. The spur gear is also much larger. This is designed to give large pulling power from this drum for hauling the log out of the woods at a slow speed, while the engines are in quick revolution. The upper drum being geared quicker winds a large amount of smaller wire rope for the purpose of hauling the pulling rope back in the woods to the starting point.

The bed frames are extra strong. All parts of the engine fitted in the best possible manner. Drum and crank shafts made of steel. The gearing is made from cut patterns. The lower drum is so arranged when ordered that it can be detached from the frame, thereby making a single-drum engine. This is done by bolting underneath the bed frame heavy wrought-iron fish plates

Mundy Steel Logging Engines

Especially adapted for hauling and yarding purposes. The bed frame, main pulling gear and winching drum are made of open-hearth steel.

The engines are very strong and capable of making long, heavy hauls. All parts of these machines are built in the best proportion, while the workmanship and material are first-class and have been pronounced by many who are using them on the Pacific Coast to be indestructible.

The boilers are made especially to carry high steam pressure, and the engine can be run at a high rate of speed, thereby producing great amount of horse-power.

Mundy Special Excavator Engines

Fig. G1404

Cast Steel Gears—Bronzed Bushed Drums—Balanced Throttle One-Piece Side Frames

These engines are specially constructed for use with our scraper excavators and should not be confused with the so-called standard contractor's hoist which is smaller and lighter in every way.

They have extra heavy one-piece side frames, doing away with joints and bolts, thus avoiding the possibility of parts getting loose from sudden shocks and jars—a very important item in a machine of this kind.

The gearing is of cast steel throughout and special large size with wide face; the drums are bronze bushed and powerful band foot-brakes are placed opposite the friction heads to prevent heating.

The cone frictions are exceptionally large, consequently only half the pressure is required to set them, which enables the operator to handle the levers quickly and without fatigue.

The illustration shows two drums and vertical boiler but our Model 1460 is now regularly furnished with three drums and a high pressure locomotive firebox boiler.

Prices quoted upon request

"Mundy" Hoisting Engine Boilers

Vertical Full Length Tubes With "Jerrold" Patent Tube Setting in Top Head, 125 lb. Steam Working Pressure

This is the very highest grade of vertical boiler built. The heads are extra heavy and the top head has the Jerrold patent tube setting. These boilers are regularly furnished with our Mundy hoisting engines, but we sell many of them for other purposes.

Boiler shells are made of homogeneous steel of 60,000 pounds tensile strength; all vertical seams are double riveted; heads and furnace of best flange steel. Heads are extra heavy. The door frame is made of forged steel and on the best principal. These boilers are easy steamers.

Price complete, includes base, grates, hood and stock, standard steam trimmings, including injector with piping, valves and connections.

"Mundy" Friction Drum Electric Hoists

With Patent Automatic Locking Brakes

Fig. G1427

Fig. G1428

The above illustrations show designs as generally furnished. We can arrange position of motors, drums and controllers to suit convenience of purchaser. Controllers of the street car pattern are furnished so that any speed may be obtained from minimum to maximum as quickly as with a steam hoist.

Our line of electric hoists is very complete, consisting of single friction drum, double and triple friction drum with winches, the best arranged handling apparatus together with the most reliable electrical apparatus that is constructed. We also furnish special types of electrical machinery such as haulage machines, continuous winding machines, etc. In ordering it is necessary to state all the electrical conditions under which the hoist will be used, also give speed that the load is to be hoisted per minute when motor is running at its full speed.

Be sure to state your current and voltage, also maximum load and speed that the hoist is to handle. Larger sizes and any combination of drums furnished promptly. Prices on request.

Mundy Electric Hoists

Fig. 1425. Standard Double Friction Drum Hoist
Regular Arrangement of Handling Levers

Fig. 1426

Standard Double Friction Drum, Contractors Electric Hoist, with Wright's Patent Single Reversing Drum Derrick Swinging Attachment

For Sizes, Etc., See Preceding Page

Fig. G 1413. Sectional View Showing Construction
See Engine Nos. 521 to 543 for Method of Attachment

Mundy, Wright's Patent Reversing Swinging Gear

For Attachment to Engine with any Combination of Drums

This boom swinging or slewing device is simple and compact, taking up less room than any other swinger on the market. It is attached in front of contractor's hoisting engine with any combination of drums and driven by steel pinion keyed into the front drum shaft and between the winch head. Operated by one lever at the engineer's side of engine.

This drum when at rest is disengaged from both frictions and for swinging the derrick is thrown into either the forward or backward motion, as desired by the movement of one lever.

Drum is compound geared to a pulling speed of approximately one-fifth to one-sixth the speed of the front drum of the main engine, for swinging the boom with the load and an increased speed of about one-third when returning without the load, thus making a saving of time.

The gears are cast steel. The friction Mundy standard cone drum has take up for wear in the form of an adjusting collar in the center.

Prices quoted upon request.

Independent Winch Shaft, With Clutch Winches and Gear

Can be attached in front of any standard double drum engine to adapt it for derrick car work. Propelling device may be attached in center of shaft.

Prices upon request.

Fig. G 1414

Fig. G 1415

Mundy Electric Compound-Geared Car Pullers or Winch Hoists

Winches Either Fixed or Clutched

These machines are equipped with large winches or "nigger heads" only, no drum. Winches can be fixed or clutched, as desired.

Clutched winches have jaw clutches, ratchets and pawls and latched levers for disengaging the clutches.

Exceptionally compact and strongly built.

When enquiring for prices, state current and voltage and if alternating current state cycles and phases also.

Prices quoted upon request.

“Mundy” Contractors’ Portable Gasoline Hoists

Fig. G1439

This hoist is designed for all kinds of hoisting where it is not practical to make use of the Steam or Electric Hoist—being a complete combination of Gasoline Engine and Friction Drum Hoist, all assembled on one Iron Bed Plate, and so constructed and arranged that the engine may be in constant motion and the hoisting and lowering of loads can be safely accomplished. The hoisting drum is provided with a powerful foot brake that will hold any load that can be hoisted with the engine.

Single Friction Drum Hoists

Rated Horse Power.....	5 H. P.	8 H. P.	10 H. P.	12 H. P.

Larger sizes and any combination of drums quoted promptly upon request.

"Mundy" Balanced Piston Reverse Valve Swinging Engines

Fig. G1410

The engine, as can readily be seen from the cut, is built very compactly, taking up a minimum amount of space.

This engine is operated by means of one lever, which cuts off the steam in its central position. Moving it forward or backward causes the drum to revolve either way, regulating the speed by the length of throw given the operating lever by the engineer. The reversing motion is taken care of by a new style balanced piston throttle valve, and unlike all other engines of this type, the slide valves in the cylinders are steam balanced, thus lessening the frictional loss in the cylinders to the smallest degree possible. When the throttle valve is closed, with the lever in its central position, the engine will hold the boom stationary in any position.

No.	Size of Double Cylinders	Cap'ty on Single Line with 80 Lbs. Steam Pres.	Approx. Weight	Price
37	3x7	4,000 lbs.	1,400	\$400.00
68	6x8	10,000 lbs.	3,500	865.00

"Mundy" Independent Swinging Engines

Compound-Geared, Link-Reversing Double Cylinders, Single Fixed Drum

Operated entirely by one lever.

One of the crank discs has band brake, which locks when engine is at rest and releases when engine is started.

Especially adapted for swinging on dredges, barges, derricks, pile drivers, etc., where extra long and heavy booms are used, or any place where the mast is liable to get out of plumb, causing the machine to list, as on barge derricks.

It is simple and compact in construction, taking up but little space, and made especially strong to stand the heavy strains due to dredge work, etc.

"Jackson" Double Cylinder, Reversible, Single Geared Drum Hoisting Engines

Fig. 1434

View of Engine, showing two Winch Heads. Can be furnished with one Winch or without as desired. Size of Winches, 5x12 inches.

For Steam or Compressed Air

These hoists are quick, simple, exceptionally compact and powerful; the cylinders and frame are cast in one piece. They are under complete control of the balanced reversible throttle. Can be stopped, started or reversed instantly, and will hold load without brake.

Adapted for mines, coal and ore docks, for pulling cars and general hoisting purposes. Before leaving the shop, every hoist is tested and run under pressure, and all working parts thoroughly inspected and adjusted. Being double-cylindere, the speed is uniform, and there are no dead centers; they, therefore, have a high lifting power as well as steady and uniform motion. The gears are protected by a wrought band to keep lines and clothing from being drawn in.

No.	Usually Rated H. P.	Double Cylinders		Will Hoist Single Line, Pounds	Size of Gears		Size of Drum, Inches	Floor Space, Inches	Weight, Pounds	Price
		Diameter	Stroke		Pinion	Gear				
66	12	6	7	2500	7	34½	12 x 20	68 x 52	2500	\$520.00
67	18	7	8	3000	7	34½	12 x 20	72 x 60	2700	575.00
68	26	8	9	4000	7	42	12 x 20	72 x 60	4200	695.00
69	30	8	10	4300	7	42	12 x 20	72 x 60	4300	735.00

Price includes throttle valve, oil cups, sight feed cylinder lubricator and two winches. If winches are not wanted, deduct \$7.50 each.

"Jackson" Double Cylinder Reversible Center-Gear Engines

For Steam or Compressed Air

These engines are completely under control with throttle, and can be stopped, started or reversed instantly.

Crank shaft, connecting rods, piston and valve rods are steel; cross head gibs are babitted, and boxes in connecting rods are of gun metal. All bearings are adjustable to wear, and of high grade anti-friction metal, to insure smooth running.

They are used successfully on dredges for hoisting dippers, swinging cranes and hoisting spuds; in saw mills for circular feeds; in iron-working shops for driving punches, shears and rolls; for driving concrete mixers, etc.

Fig. C 1435

310½	45	10	14	62x92	4400	1085.00

Can also be furnished with side instead of center gears.

Prices include throttle valve, oil cups and sight feed cylinder lubricator. Pinion is extra.

Single Drum Friction Hoist

For drawing cars up quarry inclines and lowering them after dumping. They may be operated from above, below or either end by adding the necessary connections.

They are very strong and serviceable and will handle heavy 7-yard cars on usual inclines.

Fig. G-1418

Hoist equipped for pile driving with turned winch head and extended pulley shaft having outboard bearing. The drum is used for the hammer line and the winch head for the pile line. Belted to a gasoline engine, this makes a popular outfit for light work, requiring frequent moving. Extra price sizes 1025 to 1028. Prices Quoted upon Application.

We carry an immense stock of machinery of all kinds in our Chicago warehouse.

Hand Power Windlass

Used for prospecting, in connection with a small two cubic foot ore bucket. Manila rope is usually used.

Size of timbers, 6x6. Dia. of drum, 6 inches. Length of drum, 21 inches.

Price with timbers, complete.....\$70.00

Price iron work only.....50.00

Horse Power Hoists

Single Drum with Automatic Safety Attachment and Brake.

A horse operating a derrick working at intervals, and walking at the rate of 3 miles per hour, will exert a force of 200 pounds on a straight line over a pulley. We estimate the capacity of our machines on this basis.

This machine is frequently used for mining purposes in connection with $\frac{1}{2}$ -inch steel cable and a 5 cu. ft. capacity pressed steel ore bucket. We will quote on a complete prospecting outfit on application.

Double Cylinder Mine Hoisting or Haulage Engine

This is a combination engine, constructed with link-reversing motion, double cylinders and friction drum. It is especially adapted for hoisting from mines of different levels, also for hauling trains of cars from mines being worked with incline plain, or on a level. The drum is grooved for the rope or made with plain body and also provided with a powerful band brake, and is made to carry a large amount of rope. The link-reversing apparatus, thrust apparatus and brake are all banked in quadrant with racks and latch levers at front of engine.

The engine is of the very best construction, made strong and durable and a load can be hoisted or hauled at a rapid speed. For hoisting from a shaft two ropes can be used on the drum, thus handling two cages, one cage being lowered while the other is being hoisted from the mine.

No. 720 Ingot Cars

For Copper or Other Metal Ingots and Billets
Capacity, 2 Tons

With Roller Bearings

Gauge of track, 18 inches; roller bearings of cold drawn steel; length between rails at top, 47 inches; width outside rails at top, $14\frac{1}{2}$ inches; height from rail to top of T-rack, $27\frac{1}{2}$ inches; rack, 20-pound T-rails; cross and side axle brackets, $2\frac{1}{2} \times \frac{1}{2}$ -inch steel; steel axles, $2\frac{1}{4}$ inches square; wheels solid web chilled face; diameter, 9 inches; face, $3\frac{1}{4}$ inches; cold drawn steel rollers, $\frac{3}{8} \times 4$ inches, 12 in each bearing. Weight 475 pounds.

Prices on application.

**Mining Cage, Leadville Type**

Built entirely of mild steel and Norway iron. All joints machined and fastened together with turned steel bolts, no rivets used. The highest type of cage for severest service.

Single-deck cage, weight 1,400 pounds. Double-deck cage, weight 2,000 pounds.

Prices on application.

Automatic End Dump Quarry Cars

Fig. 608. Steel Car

Fig. 613 Wood Car

Made in sizes 1 yard to 3 yards capacity of either steel or wood to suit purchaser's requirements. Track gauges usually 30 to 48 inches. Wood cars are of oak and may be had with steel lining if desired.

Be sure to state in inquiring for prices—Number of cars wanted; track gauge; whether all steel or wood; if wood, whether lining is wanted; if so, on bottom only or throughout inside; kind of material to be handled; kind of wheels and bearings preferred, and what limitations to size of car, if any.

Coal Mine Cars

Built to order only, of either steel or wood, to special proportions and of any gauge of track, in capacities from 20 to 80 cubic feet. We furnish plain or chilled wheels, with or without self-oiling hubs.

Dimension Diagram

Illustration shows Style M Car, Cast or Steel Bumper

Inquiry Blank

State number and style wanted and gauge of track.

Style and diameter of wheel.

Kind of axle—square or round.

Distance "F" (centers of axles).

When wheels are tight on axles give information as to inside or outside bearings, and state kind of oil boxes desired; also give length and diameter of journal.

Capacity in cubic feet level full (about 40 cubic feet to the ton).

Distance "a" "b" "c" "d" "e" in dimension diagram.

Distance "h" when extra vertical plank is used.

Distance between bumpers of four-bumper cars.

Height that car is wooded up in rear end above bottom plank.

Thickness of bottom and side planks.

Size of iron for front, center and rear binders or belts.

Bumpers, side or center and size of iron.

Size of rear cross binder.

Diameter of hole in end of draw-bar.

Standard Steel Ore Cars

Leadville Type. Dumps at End or on Either Side. 18 Inch Gauge
(Prices on Application)

Fig. 526A
Lever Dump Ore Car

For General
Mining,
Drift or
Cage Use.

Wrought steel turntable: truck frame either of oak or steel, as specified. Wheels are chilled cast iron with extra wide tread, fitted with malleable self-oiling, dust proof caps. Axles are square steel.

Fig. 527A
Automatic Dump Ore Car

Fig. 526A. A single lever operates the hinged door and locks the body of car frame.
Fig. 527A. The door hook is hinged to a rod, the joint sliding in a yoke. The rod is controlled by a cam lever, pivoted to its opposite end, supported by a bracket and against the face of the turntable when the car is upright.
On tipping the car body the cam lever descends, allowing the door to be opened by the weight of the load. Righting the car body securely locks the door.

Contractors' Two-Way Dump Cars

Capacity $1\frac{1}{2}$ to 6 Cubic Yards. Level Full. For Hand or Steam Shovel Work

Angle of dump on all cars is 45 degrees.
 In dumping load is thrown clear of the track.
 Bronze journal bearings.
 All wood parts of hardwood.

Cut Shows 6
Yard Car in
Dumping
Position

The trucks of the 3, 4 and 6 yard cars are of the diamond frame type, with heavy I beam cross sills and Pressed Steel Channel Arch Braces. The wheels have faces, bronze journal bearings and springs over axles on 3-yard capacity and larger.

The $1\frac{1}{2}$ yard car has trucks of steel channels and I beams.

The door suspension is patented and of great importance, as it leaves the door free to swing outward if struck by rock or frozen earth, and gives a far greater dumping clearance than can be had with a rigid door, it also avoids the use of a separate lever. The door always locks when returned to carrying position.

In Ordering State

- (1) Style of truck. (2) Size of axle. (3) Diameter of wheel.
 (4) Wheel base, or distance axles are spaced apart on centers.
 (5) Track gauge (the exact distance between heads of rails inside).
 (6) State whether wheels are desired with solid center plug bolt or with patent malleable spring cage oiling device, or with old side plug.

Universal Ball Bearing Turntable

One man can operate these tables when loaded to full capacity.

The table is revolved on a serpentine circular track filled with 2, 2½ or 3-inch balls—according to the diameter. As the weight of the table is sustained only by those balls at the highest point, friction is greatly reduced. Of course the balls roll around the race course in the ordinary manner, only as they roll up and down but a few carry the weight at one time.

"Universal" tables are neat, strong and substantially made, weights distributed so as to reinforce parts subjected to the greatest strain.

All tables, regardless of size and style, are 6-inch in depth, allowing of their being placed in any flooring. Their construction is such—the top casting overlapping the bottom—that there are no places for dirt to accumulate. This makes the "Universal," in addition to its many other virtues, a dirt proof table.

The locking device furnished with "Universals" Nos. 2 and 3 is positive, automatic and at all times out of the way.

When ordering state style, number of tables required, gauge of track and wheel base of cars—or diameter of tables—if flange of wheels runs on the outside, please advise, otherwise will assume that it rests on the inside.

No. 1 table has plain checkered top without locking device. No. 2 has grooved top with locking device. No. 3 has grooved top locking device and guard rails.

96		4000	5700	5300	480.00	560.00	530.00

This is a very efficient and easy operating turntable. There is no tipping, no getting out of line, no trouble to keep in order and no journal friction.

Made in three types as listed, plain top, grooved and raised rail.

There is no center bearing. The entire load is on the chilled rollers, turning on roller path near the outside of the table. These rollers are conical and cannot slide or grind against each other, being held rigidly apart by spacing frame. There is only rolling friction resulting in an easily turning table. No oil is required.

Frogs for 42, 48 and 60-inch, per pair\$4.00
Frogs for 72 and 96-inch, per pair\$5.00

"Open-Top" Turntable

No. 960 open top turntable revolves on a center pivot and outside rollers. Is easy to operate and is durably built.

Price List

List No.	Diameter, Inches	Track Gauge, Inches	Weight, Pounds	List Price
960	42	18 to 24	230	\$34.00
960	48	18 to 30	245	37.00
960	60	18 to 36	327	46.00

Equipped with 12-pound rail unless otherwise specified.

No. 10 Motor Velocipede

Engine $2\frac{1}{4}$ H. P. Air-Cooled. Speed 4 to 20 Miles per Hour

Can be Handled by One Man on or off Track

Gasoline Tank Holds Supply for Two Hundred Mile Run

Car is driven by a special roller chain with nickel steel rivets. Chain has a strength of 2500 pounds. Sprockets are provided with friction device so that in case of undue slack chain will not break.

The frame is of selected ash; wheel base is 46 inches; pressed steel wheels, 17 inches diameter; light and strong.

Starts without cranking. Equipped with five-cell battery and waterproof spark coil; has gravity sight-feed lubricator.

Price.....\$250.00

Four-Wheel Light Inspection Cars

Ball Bearings Throughout

Single-seated Car, Built any Gauge

Double-seated Car, Gauge 3 Feet and Larger

The single-seated car is fitted with detachable luggage basket and tool bag. Geared to suit grade conditions. The standard gear is 62; options of 52, 58 or 73. Net weight, 65 pounds. Shipping weight, crated, 100 pounds.

Price.....\$65.00

The double-seated car is geared same as the single-seated. Net weight, 75 pounds. Crated for shipment, 125 pounds.

Price.....\$85.00

Detachable front seat for either car; weight, 15 pounds. Extra.....7.50

Railroad Velocipedes

Light, durable and easily operated and handled.
Built of tough rock elm, with patent singleplate pressed steel wheels, with ball bearings.

No. 1 Standard

As shown by illustration above. Weight, 150 pounds.
Price.....\$70.00

No. 2 Velocipede

For two persons. Same style as No. 1, but with seat for passenger. Weight, 158 pounds.
Price.....\$73.00

No. 3 Telegraph Car

For three persons. Can be operated by one man, if desired. Has box for carrying tools and supplies. Weight, 195 pounds.
Price.....\$90.00

No. 65 Railroad Push Cars

Extra heavy; standard gauge; platform 7 feet long by 5 feet 7 inches wide; pressed steel wheels 20 inches in diameter; machine steel axles 2 inches in diameter. Weight, 700 pounds.

Price.....\$40.00

Railroad Hand Cars

With Pressed Steel Wheels

Illustration Shows No. 1 Car

No. 1 Standard Hand Car

Standard gauge; platform 6 feet long by 4 feet 5 inches wide; wheels 20 inches in diameter; axles 1 1/2 inches diameter. Weight, 500 pounds.

Price.....\$60.00

No. 2 Bridge Gang Car

Standard gauge; platform 8 feet long by 5 feet 7 inches wide; axles 1 3/4 inches diameter. Weight, 700 pounds.

Price.....\$72.00

No. 5 Inspection Car

For use of roadmasters and supervisors of track, bridge builders, etc.

Same size platform as No. 1 car. Furnished with single or double end lever, as desired. Weight, 475 pounds.

Price.....\$80.00

10-Ton Track Laying or Rail Car

Standard gauge; size, 8 feet long by 6 feet 6 inches wide; chilled wheels 16 inches in diameter, with 6-inch tread; axles, 2 3/4 inches in diameter; capacity, 10 tons; sills, 4x8-inch oak; cross sills plated with iron; car fitted with chain and tool boxes, and has two rollers at each end. Weight, about 2000 pounds.

Price.....\$120.00

Hyde Hand Power Capstans

All have six holes for capstan bars. Ratio power to speed, about $2\frac{1}{2}$ to 1

These capstans are operated by men pushing against capstan bars inserted into holes shown in the head. To change from power to speed, it is only necessary for the men to walk in the opposite direction, and vice versa.

A feature of importance is that the strain is taken by both the inside as well as the outside pawls and as the inside pawls are sufficiently strong to hold the load even if the outer ones were left off entirely, the danger as well as the annoyance of "jumping" is avoided. The gears are in the lower part of the barrel where there is room to make them of ample strength.

All bearings are of composition metal and all parts are interchangeable and can be duplicated at any time.

No.	Price Each	Diameter of Barrel, Inches	Diameter of Base, Inches	Height, Inches	Approximate Weight, Pounds
7A	\$ 70.00	8 $\frac{1}{4}$	24	27	375
6B	90.00	8 $\frac{1}{2}$	26	29	500
5C	100.00	9	29	32	600
4D	120.00	10	30	34 $\frac{1}{2}$	730
3E	144.00	11	32	40	1070

Wooden capstan bars are extra. Per foot \$0.50

Hyde Steam Capstans

Showing engines bolted up under deck.
Can be set up also on deck below
as desired.

These capstans are built in a thorough manner and are superior to any others on the market. They can be used as hand capstans as well as steam capstans. The gears for obtaining power, when used as a hand capstan, are all in the base, and are of ample strength.

All bearings are bushed with composition, and all parts are made interchangeable.

The engines are simple and compact and not liable to get out of order.

The cylinders, slides and main bearing are made in one casting. All surfaces that are bolted together are planed and secured by fitted bolts.

The worm is inclosed in a cast iron casing and runs in a bath of oil, insuring perfect lubrication.

Each machine is thoroughly tested before it leaves the works.

The engines may be bolted up under deck as shown in cut, or they may be placed on the deck with reverse side up.

This latter plan is preferred where there is room, as all parts of engine are more accessible.

No.	Price Each, Non-reversing	Double Cylinder Engines		Diameter of Capstan Barrel, Inches	Diameter of Capstan Base, Inches	Approximate Weight, Pounds
		Diameter, Inches	Stroke, Inches

Porter Light Saddle Tank Locomotives

New Design for Contractors, Logging, Plantations, Inside and Outside Mines, Rolling Mills, or Other Service.

Built 30-inch Gauge and Upward

The above design is the most popular and widely used contractors' locomotive built. Kirwan and Kittel are usually kept in stock for immediate delivery for 36 inches gauge. The Kittel is the size most generally used by contractors. These locomotives are built with boilers to insurance companies' requirements, and abundantly free steaming; best forged iron frames; steel crossheads; open hearth steel forgings; best materials and workmanship and of design which is the result of 35 years' experience. All Porter Co.'s locomotives are built to exact system, and duplicate parts which will fit correctly are kept on hand in stock. These locomotives are especially adapted for industrial service, coal and ore roads, quarries, tramways, etc.

On 1½ per cent grade—26 4/10 feet per mile.....	90	130	180	235	295	345
On 1 per cent grade—52 8/10 feet per mile.....	50	75	105	140	180	210
On 2 per cent grade—105 6/10 feet per mile.....	25	40	55	75	95	105
On 3 per cent grade—158 4/10 feet per mile.....	15	25	35	45	60	75

Note.—The above figures for hauling capacity are based on a frictional resistance of 6½ pounds per ton of 2,000 pounds. In practice this may run 5 to 10 pounds for good cars and track, or much higher for poor cars and track.

The "Junior" Winch
With Pawl Stop

The Junior is very compact and suitable for general light hoisting—is largely used for hoisting at camps. Regularly furnished with one crank or handle, but two can be furnished, if desired, at a slight extra cost.

The No. 12 Winch is worm-gear and holds the load suspended safely at any point; load cannot slip or run down—the handle must be turned to lower the load. No. 13 is the same as No. 12 except in size of drum.

Single and Double Drum Power Derrick Winches

For Compressed Air or Steam

Single and Double
Drum Power
Derrick Winches
For Compressed
Air or Steam

The drums are operated by a reversing motor which is attached with its main journal to the back of the iron frame. As the motor is self-contained, it cannot get out of alignment and there is very little vibration because the outer piston is the only reciprocating part of the machine.

All machines are equipped with brake bands, pawl, ratchets and levers for throwing in and out the pinions. The intermediate shafts are fitted for cranks for hand power in case of emergency when steam or compressed air is not at hand.

The winches can be furnished with an additional set of gears and pinions for faster speed at a small extra cost.

3½ K	7	5000	40	1310	1400	\$440.00	\$535.00

The "Duplex" Hoisting Jack or Winch

This type of winch or "Jack" as it is sometimes called is largely used for raising windmill towers during construction but can be used in many other places as well.

The power is multiplied 32 times so that one man exerting 50 pounds' pull on the crank can hoist about 1600 pounds.

The winch has a concave drum so that it is necessary to maintain tension on the end of the rope opposite the load while hoisting; see cut.

The drum is hinged to the frame, so that operator can tip the drum up and drop the coils of rope around it. Machine has folding legs in front, also angle steel leg that can be slipped over a post as shown; equipped also with ratchet and pawl for holding the drum, when pressure is removed from the cranks. Price, \$25.00

Steel Champion Circle Swing Builders' Derrick

Capacity 1,000 pounds, weighs only 200 pounds, can be operated by hand, horse or power. Height, 7½ feet; boom extends 5 feet. Equipped with 110 feet crucible steel cable, block, cleats, and bolts for fastening, complete ready for work.

Price, hand power	\$50.00
Price, hand and power	51.35
Extra cable, per foot07

Drum holds 135 feet.

This portable derrick is built of all steel, has self-lubricating bushings, load and boom brake. Boom can be removed in a few seconds by loosening one nut and raising 2 inches. Bottom sills and mast fold together, making it in two parts, compact enough so that a contractor can haul it to jobs in his auto.

For loads up to 1,000 pounds our Steel Champion cannot be excelled by anything on the market.

Peerless Circle Swing Steel Derrick

Capacity 1,800 pounds, weight 275 pounds, height 8 feet, swing 10 feet. Equipped with 125 feet crucible steel cable, block, cleats, and bolts for fastening, complete ready for work.

Price, hand power	\$63.00
Price, hand and power	66.00
Extra cable, per foot07

Drum holds 175 feet.

This portable derrick is built of all steel except bottom sills, has self-lubricating bushings, load and boom brake, can be used, hand, horse or power. Boom can be taken off in an instant by removing one nut. The bottom sills and mast fold together making it easy to remove or put up. Many contractors haul them to jobs in their automobiles. For the above reasons the machine is almost indispensable to contractors who build from 2 to 4 story buildings; for hoisting joists, timbers, iron, stone, terra cotta, reinforcing bars, wheelbarrows, etc.

Standard Circle Swing Builders' Derrick

Capacity 2,500 pounds, weight 350 pounds, height 8 feet, swing 10 feet. Equipped with geared winch, 150 feet ¾-inch steel cable, block, cleats and bolts for fastening. Complete ready for use.

Price, hand power	\$66.00
Price, hand and power	70.40
Standard with steel boom, extra	3.00
Extra cable, per foot07

Drum holds 275 feet.

All crucible steel and malleable fittings, including winch, making it strong and safe on buildings. Has boom and load brake and is built so that the boom can be quickly detached. Mast folds to bottom sills, making it easy to take apart or set up. It has no equal for hand or power hoisting and is the only full circle swing builders' derrick of the capacity stated.

1, 2 and 3 Ton Capacity

Channon Stiff Leg Derricks

Our Stiff Legged Derricks are built with split mast and boom, fitted throughout with crucible steel fittings, making the derricks light and strong and easy to set up. They can be used by hand or power and are especially handy on buildings. Gears and frames of our double hoisting winch are also made of crucible steel, which means safety and no breaking of gears. Our 1-ton bottom sills work hinge-like in front, and can be set at angle desired.

One ton legs and sills are 4x6, split mast and boom two 3x6.

Two ton legs and sills are 6x6, split mast and boom two 2x6.

Three ton legs and sills are 6x8, split mast and boom two 3½x8.

Channon Pole Derricks

Capacity, 1,400 lbs., with winch not geared, or 2,500 to 3,000 lbs., equipped with geared winch. Weight from 200 to 300 lbs., according to capacity. Built of 5½x5½ selected wood with extension sheave frame, so that the load can be hoisted to top without scraping hole. Equipped with rollers at the bottom, winch, cable, and block, complete ready for hoisting. No guy lines.

Capacity 1,400 lbs. 18 ft. \$38.50
Equipped with 110 ft. cable 20 ft. 40.50
Block, winch not geared . 22 ft. 41.50
Capacity 2,500 to 3,000 lbs. 18 ft. \$46.50
Equipped with 125 ft. cable 20 ft. 48.00
Block, geared winch. 22 ft. 49.50

If longer lengths are desired add \$1.50 per ft. Fish tackle to swing derrick out and in, containing 5 blocks and 50 ft. ½-in. rope, \$5.00.

Channon Setter Derricks

Have many improvements over the old style Setter Derricks. The top frame made of the best malleable iron, and equipped with two sheaves—does away with the block on top, and increases the hoisting height about two feet—is extended forward which enables one to hoist the load without scraping the derrick. Have lugs for guy lines in front and back and also clamps for fastening extension pole. The shaft boxes are so constructed that the drum and gear shafts can be taken off without removing boxes. The bottom and side pieces are connected with two malleable castings. This makes a very strong connection and enables one to take it apart if necessary. The derricks are equipped with steel gears and both are built on the same order, with the exception that the Top Point is considerably lighter and side timbers come to a point at the top.

	Capacity	Length	Price		Capacity	Length	Price
Top Point.	3000	18	\$48.40	Regular.	4000	18	\$56.00

No. 17 Sulky Trench Derrick

A Portable Derrick for Laying Sewer and Water Pipe

The rear leg folds back, allowing the whole derrick to be transported on the wagon wheels shown—can be hitched to the back of any wagon—pulled through the streets on its own wheels and is quickly set up again ready for work.

The wagon wheels act as cranks with long leverage and several men can work on each side. Winch has lever brake.

Chain is shown in illustration but wire or manila rope is now used almost altogether.

A two part tackle is shown but any number of parts may be used to suit the load to be handled.

Size No.	Height, Feet	Size of Timber, Inches	Size of Drum, Inches	Capacity Single Line, Pounds	Price without Chain or Block

Traveling wheels—for moving lengthwise of the ditch together with bottom cross-brace, extra.....\$16.65

No. 27 Folding Wood Tripod Derrick

This derrick is similar to the one above but has hand cranks for two men instead of wagon wheel cranks.

Largely used in cities for hoisting out of man-holes, sewer and pipe line trenches, caisson holes, etc.

Can be supplied with wheels at bottom of legs for traveling—see extra price below.

Size No.	Height of Timbers, Feet	Size of Timbers, Inches	Diameter and Length of Drum, Inches	Capacity for Two Men on Single Line, Pounds	Price of Ironwork only, No Timber, Blocks or Rope	Price with Ironwork Attached to Timbers and Painted, No Rope or Blocks

Blocks and ropes are priced elsewhere in this catalog.

No. 118 Channon Portable Folding Pipe Tripod Derrick

Used by Safe Movers, Marble Works, Cemeteries, Etc.

These derricks are made of pipe and can be folded together for transportation.

They are light, convenient to handle and take up little room when not in use—they are always ready, as nothing has to be taken apart that might get lost.

The bottom of each leg is supplied with spikes, giving a firm grip on the floor.

Prices do not include chain hoist which is priced elsewhere in this catalog.

Chain Hoists of all kinds are listed in another section.

Channon Derricks

FIG. 611

Channon derrick irons are of simple design and well proportioned throughout—care has been taken to make the wood work as simple as possible, so that men of ordinary skill can readily fit the irons to the timbers.

The capacity of a derrick depends upon so many things that we cannot quote intelligently unless we have all the information asked for at the bottom of this page.

The capacity depends upon the size and also the quality of the timbers used—for ordinary lengths our irons are stronger than the timbers—where the booms are long, larger timbers are necessary. The ratio between the length of the boom and the height of the mast also determines the capacity—our ratings are usually based upon a ratio of boom to mast of 1.5 to 1 with the boom about 15 degrees from the horizontal as shown by Fig. 611—shortening the mast lowers the capacity—increasing the length of the boom above this ratio does the same.

The number of sheaves in the fittings or blocks is determined by the capacity of the engine or winch to be used—it is usual to allow one, or better, two more lines in the boom topping lift to allow for the weight of the boom and its fittings, blocks, chain slings, etc.

We furnish all derrick irons with our self-lubricating graphite-plug bronze bushings (described below), unless otherwise specified.

We furnish complete derrick outfits, comprising engines, winches, derrick irons, bull-wheels, wire rope, rope clips and thimbles, and while we show only a few styles in this book we can make up any combination desired in a few days.

Bushing of Sheaves

Self-Lubricating,
Graphite-Plug
Bronze Bushing

Tests of common bushed sheaves have shown a loss of power through friction to be as high as 12 per cent of the weight carried by each sheave—the same tests showing but 5% loss when our self-lubricating bushings were used. Our bushings require no oil or attention and are suitable for heavy loads and high speeds.

This bushing is a casting made of a hard phosphor-bronze composition with drilled holes filled flush with a special graphite, or plumbago, lubricant baked in.

When a bushing is worn out another can be obtained at small cost, saving the cost of a new sheave.

These bushings are listed separately in another section.

Under no circumstances do we guarantee derrick irons or machinery unless specifically agreed upon in writing. Any parts proving defective will be replaced, provided they are tested immediately after delivery and notices of defects given us promptly; but in no case do we assume responsibility for any delay or damage.

Be sure to give all the information asked for.

No. 30 Channon Hand Power Guy Derrick

This is the simplest form of derrick—consisting of only two sticks—the mast and the boom.

It is easily set up and can be quickly moved from place to place.

The combination of irons shown is the lowest priced we make on account of using strapped sheaves instead of blocks in all except in hoist fall block—a flat bolted band in boom point, No. 715 Guy Cap, simplest form of mast bottom, etc.

A single drum winch can be used instead of the double drum shown, in this case the boom line is usually of Manila rope and the line fastened to a cleat at the back of the mast.

We can furnish Manila rope sheaves throughout, but wire rope is recommended as being more satisfactory in the long run.

Each guy rope is usually three or four times the height of the mast, depending upon the contour of the ground and the location of the "dead-men." Guys are usually galvanized steel of 6 strand, 7 wire construction.

Booms should be 4 to 8 feet shorter than the mast to clear the guy ropes. Sheaves listed are self-lubricating bronze bushed.

Total of above Iron work.....	\$119.00	\$143.20	\$178.85	\$251.85	\$362.80

Above prices include self-lubricating sheaves. Deduction for plain sheaves—see separate list of derrick parts. Winches, Guy ropes with take-ups, Hoist Lines, Clips and Thimbles are priced in other sections of this Catalog.

No. 31 Channon Combined Hand and Power Guy Derrick

Same remarks apply as on our No. 3. This is a popular derrick where the raising or lowering of the boom take place but few times a day as in a quarry—the hoisting line may be operated by any single drum power hoist.

The single drum winch may be single or double purchase—depending on the load.

Same may prefer to run the hoist line down the boom—in this case use No. 749 center pintle mast bottom and No. 845 single mast sheave (shown dotted) at the base of the mast.

This style of derrick can be arranged with other styles of mast bottoms, boom points, etc. Shown in the pages following.

On level ground the guy ropes are usually three times the height of the mast.

Booms should be 4 to 8 feet shorter than the mast to clear the guys. Sheaves listed are all self-lubricating bronze bushed.

Total of above iron work.....		\$135.00	\$162.50	\$198.10	\$276.35	\$384.45

Above prices include self-lubricating sheaves—deductions for plain sheaves—see separate list of derrick parts. Engine, winches, guy ropes, take-ups, hoist lines, clips and thimbles are priced in other sections of this catalog.

No. 32 Channon Power Guy Derrick

This derrick is fitted with a double sheave step so that both boom and hoist fall lines can be handled by power.

The mast bottom shown has a center pintle but we can furnish offset pintle so that both lines lead down the face of the mast—this avoids cutting the bottom of the mast which saves time in fitting and leaves the full strength of the timber.

For quick work we would recommend one of our bull-wheels to be attached to the bottom for swinging the boom by power instead of by one or two men pulling on hand lines—when arranged with power swinging attachment the engineer can hoist and swing the load into place, in the same time it would take to hoist the load only.

On level ground the guys are usually three times the height of the mast.

Sheaves listed are all self-lubricating bronze bushed.

Hoist Fall:—One No. 842 Single strapped sheave.....	8.00	10.00	13.00	17.85	22.30
and one single hoist fall block with swivel hook.....	10.00	12.00	13.90	30.70	35.20
Total of above iron work.....	\$149.85	\$178.20	\$226.60	\$315.90	\$430.95

Above prices include self-lubricating sheaves—deduction for plain sheaves—see separate list of derrick parts
Guy ropes, guy take-ups, hoist lines, clips and thimbles are all priced in other sections of this catalog.

No. 33 Channon Improved Power Guy Derrick

This improved type of guy derrick has structural steel mast top, improved steel boom point, plate steel guy cap and a ball and socket mast step.

The derrick swings easily whether the mast is out of plumb or not—this step has oil reservoir and gib keys to prevent the mast from "kicking" out of the step—the bearing surfaces of this step are always in contact even with the mast out of plumb.

The bottom pintle is off-set as is the gudgeon pin allowing the lines to pass straight down the face of the mast—there is no cutting of the derrick timbers except for the boom point sheave.

We can furnish a center pintle mast bottom for those who desire it—see separate derrick parts.

For quick work we recommend a bull wheel and power swing.

On level ground the guys are usually three times the height of the mast.

Sheaves listed are all self-lubricating bronzed bushed.

No. 34 Channon Grab Bucket Power Guy Derrick with "Rooster" Top

Showing application of bull-wheel which can be attached to any of our derricks.

We carry in Chicago stock, hayward clam shell and orange peel buckets up to $1\frac{1}{2}$ yard capacity.

This excavating derrick in combination with one of our Mundy Hoisting Engines makes a fine portable unit well adapted for miscellaneous digging on railroads, bridge and general contract work. We furnish either clam-shell or orange-peel buckets depending upon the character of material to be excavated. These buckets require two friction drums for their operation, another friction drum for raising and lowering the boom besides the swinging drum making four drums in all—see engines Nos. 473 to 499. Can be operated by two drum engine if the boom is not raised or lowered by power and providing the derrick is swung by hand.

Digging with grab-buckets is hard work on a derrick and larger sized timbers than those used for ordinary hoisting are recommended.

Be sure to state size or weight of bucket and the length of the boom.

Above prices include self-lubricating bronze-bushed sheaves throughout—other styles of irons can be used if desired—see separate list of derrick parts. Hoisting engines, bull-wheels, guide sheaves, guy ropes, guy take-ups, hoist lines clips and thimbles are all listed in other sections of this catalog.

No. 36 Channon Hand Power Stiff- leg Derrick

Stiff-leg derricks are practically self-supporting and are usually preferred to guy derricks on account of the difficulty of attaching and locating long guy lines.

The boom swings to about three-quarters of a circle. We recommend the use of wire rope but can furnish sheaves for manila rope at the same price. We can furnish a single drum which instead of double drum shown—in this case Manila rope is used for the boom line which is then fastened to a cleat at the back of the mast.

Capacities are estimated for booms about one and one-half times the height of the mast, which is usual; shortening the mast lowers the capacity, lengthening the boom does the same.

Booms can be as long as twice the height of mast but this ratio is not recommended on account of the greatly increased stresses set up.

For greater boom and hoist purchases deduct blocks listed and add proper blocks for capacity of the winch to be used.

Total of above iron work.....	\$191.80	\$230.75	\$285.50	\$388.50	\$613.25

Above prices include self-lubricating bronze-bushed sheaves throughout—deductions for plain sheaves see separate list of derrick parts. Winches, wire rope, clips and thimbles are priced on other sections of this catalog.

No. 37 Channon Combined Hand and Power Stiff- leg Derrick

Same remarks apply as for No. 36 derrick. Arranged with single drum winch for raising and lowering the boom—where this takes place but few times a day—the hoisting line may be operated by any single drum power hoist. This single drum winch may be single or double purchase, depending upon the load. Some may prefer to run the hoist line down the boom—in this case, use center pintle mast bottom and No. 845 single mast sheave. This same derrick may be arranged with other styles of fittings—see pages following. This style of derrick should not be used with booms longer than one and one-half times the height of the mast. For greater boom and hoist purchase, deduct blocks listed and add proper blocks for the power to be used.

Above prices include self-lubricating bronze bushed sheaves throughout—deductions for plain sheaves—see separate list of derrick parts. Winches, wire rope, clips and thimbles are priced in other sections of this catalog.

No. 38 Channon Full Circle Stiff-leg Derrick

These derricks are used where room is limited, and it is found impossible to use wire rope guys on account of buildings, tracks, etc. When used on a dock, a combination of one stiff-leg and two guys is often desirable. Where the location will permit, the sills of the stiff-legs are sunk about six feet below the surface of the ground. When the sills are used on the surface, they must be loaded down or bolted to the foundation. This style of derrick requires a mast about 10 feet longer than the boom. Can also be furnished with double sheave step for operation by power.

Total of above Ironwork.....		\$273.45	\$310.45	\$361.55	\$476.75	\$702.95

Above prices include self-lubricating bronze-bushed sheaves throughout—deductions for plain sheaves—see separate list of derrick parts. Winches, wire rope, clips and thimbles are priced in other sections of this catalog.

No. 39 Channon Power Stiff-leg Derrick

This derrick has a center pintle mast bottom with ropes running through hole in the base of the mast to the double sheaves in the step. We can furnish off-set mast bottom No. 750 if desired—in this case No. 768 mast sheaves are omitted and No. 855 would have double sheaves—both lines leading down the face of the mast.

For quick work we would recommend one of our bull-wheels to be attached to mast bottom casting for swinging the boom by power instead of by one or two men pulling on hand lines. When arranged with power swing one man—the engineer—can swing and hoist the load in the same time it would take to hoist the load only.

Capacities are estimated for booms one and one-half times the height of mast; shortening the mast lowers the capacity—lengthening the boom does the same.

No. 41 Channon Grab Bucket Stiff-leg Derrick with "Rooster" Top

This derrick combined with one of our Mundy Hoists makes an outfit well adapted for excavating on railroads, bridge and general contract work. We furnish either orange-peel or clam-shell buckets depending upon the class of digging. When the winch is used for boom line a standard derrick engine with two friction drums and swinging drum can be used. Digging with grab buckets is hard work on a derrick and larger sized timbers are recommended than those ordinarily used for general hoisting. Bull-wheels are always used on grab bucket work for power swing and for continuous and quick work we recommend an independent swinging engine described in another section of this catalog.

Illustration No. G947

Hayward Counterweight Hoisting Drum

For Grab Bucket Operation

The addition of this drum to a contractor's standard hoisting engine, having two drums and a boom swinging drum, permits the operation of a two line grab bucket as well as raising and lowering the boom and swinging by power.

The back drum is used to raise and lower the boom, the front drum for closing and hoisting the bucket and the counterweight drum for holding the bucket while opening to discharge the material.

The application of this drum and the run of the lines is shown on drawing No. 832 below.

Ordinarily for this work a four-drum engine is required—two drums for the operation of the bucket—one for raising and lowering the boom—besides the swinging drum.

This counterweight drum can be placed alongside the main engine in any convenient position and is operated by a foot treadle alone.

Run of Lines. The bucket "holding" line, which the counterweight drum operates, is attached to the top of the grab bucket, runs up over the sheave at the point of the boom, down to the sheave at the face of the mast, thence down and around the sheave in the mast step to one side of the counterweight drum.

From the other side of the counterweight drum a line is run through a block attached to the upper part of the derrick stiff-leg, down to the counterweight which consists of three pieces, one weighing 100 pounds and two weighing 50 pounds each, making a total of 200 pounds in all, additional 50-pound weights can be supplied on special order.

The closing and digging line of the bucket passes around the power wheel of the bucket and runs same as closing line, to front friction drum of engine.

After the bucket has been filled, hoisted and swung to desired position, the bucket is dumped by stepping upon the foot lever of the counterweight drum and releasing the closing line.

No. 1.—For Orange Peels up to and including 1 yd. and Clam Shells up to and including 1½ yd. \$300.00
No. 2.—For Orange Peels up to and including 1½ yd. and Clam Shells up to and including 2 yd. 375.00

Fig. 832. Showing Application of Counter Weight Drum

Channon Steel Derricks

Fig. G2173—On Building Work in Chicago

The derricks shown above were designed for erecting structural steel work on high office buildings in the city of Chicago. The mast and mud sills are about 38 to 45 feet in length, with booms any length desired and in capacities to suit requirements.

The steel work is built to the 1906 specifications of the Amer. Ry. Eng. and M. of Way Ass'n. Steel is open hearth railway bridge grade and the design and workmanship is unsurpassed anywhere.

The mast bottom and step are annealed steel castings, ball and socket type, the step is in two parts with large bolts and can be taken apart quickly; with this arrangement it is impossible for the mast bottom pintle to bind or kick out of the step.

The mast top connection for stiff-legs may be had in the usual goose-neck construction of Swedes iron or mild steel, or in a one-piece, hooded steel casting, working over a hollow steel gudgeon pin with a large bronze bushing oiled by grooves from hollow gudgeon which is protected by a cap from dust and dirt.

The topping lift is attached at mast head by links or bars fitting a large cross pin passing through gudgeon. All links and bars are of Swedes iron.

The connections at the point of boom, for topping lift and hoist fall, are by heavy plates centering all stresses properly, as will be noticed in above cut.

The mast is constructed of two channels with plates the entire length in front, or with lacing bars front and back as may be desired or required by the loading.

The sheave in the point of boom is protected by guards, top and bottom. The point is also provided with two connections for swing lines when swung by using winch heads—bull wheels furnished if desired.

The sheaves at the bottom of mast permit the boom to be raised "straight up" as there are no sheaves at the top of masts. The top plate at the heel of boom is cut out for the sheaves so that boom may be raised to vertical position.

Prices on steel derricks quoted upon request.

Showing Photograph of 12 Foot

Channon Steel Derrick Bull- wheels

For Swinging Booms on
Power Derricks

This Bull-wheel is a most valuable feature on any derrick, and will save enough time and labor to pay for itself several times in a season.

May be attached to any of our power derrick mast bottoms.

It takes time and money to swing a derrick by hand with men pulling on the tag line when teams, cars or men are waiting for the derrick.

With our Bull-wheel and special derrick swinging engine the engineer can lift the load and swing it into place in the same time it takes to do the lifting only.

Our wheel is exceptionally strong and well braced.

Sizes and Prices Complete with Braces to Mast and Turnbuckle Rods to Boom but Without Guide-Sheaves

No.	Diameter in Feet	For Derrick Booms, Length	Size of Channel Iron Used	Weight Complete, Pounds	Price Complete
1	8	40 ft. or less	5-inch	1100	\$140.00

18	6	1¾	7⁄8	00	19.35	27.20

*14-inch is the size mostly used.

Channon Derrick Irons (Mast Tops)

No. 720 Mast Top

For Power Derricks

Including Gudgeon Pin and Collar. Straps to Mast with Bolts and Wrought Eye-bolt for attaching Boom Block.

The eye-bolt extends clear through the top casting and the eye is punched and worked out avoiding the possibility of an imperfect weld.

Suitable for power guy or stiff-leg derricks. For guy derricks strapped sheaves or boom block is attached to eye-bolt direct and guy cap for guy ropes added.

For stiff-leg derricks "goose-neck" or top stiff-leg irons are used and chain welded into eye-bolt or attached by shackle through the eye.

Size of Mast Timber, Inches	Diameter of Gudgeon Pin, Inches	Approximate Weight, Pounds	Price as Shown
8x8	2	135	\$26.40
10x10	2 1/2	225	29.00
12x12	3	365	31.40
14x14	3 1/2	460	45.00
16x16	4	765	72.50
18x18	5	1160	91.00

No. 720A Top

For Power Guy Derricks

Showing plate steel guy cap and strapped sheave. Cap and sheaves will be found listed in the following pages.

No. 720B Top

For Power Stiff-Leg Derricks

With Chain, Strapped Sheave and Wrought Collar placed at top of the gudgeon pin—can furnish this style or as shown below. Chain allows boom to swing clear against stiff-legs. Block is recommended in place of strapped sheaves.

No. 720C Top

For Power Stiff-Leg Derricks

Chain is welded into eye-bolt which passes through top casting. Chains, blocks and sheaves are listed elsewhere in catalog.

No. 719 Structural Steel Mast Top

With Off-Set Gudgeon Pin

When used with our No. 750 Mast Bottom—the lines lead straight down the front of the mast—no cutting or boring of timber for mast sheaves is necessary—the mast stands plumb.

For stiff-leg derricks a few feet of chain is used between block and pin in mast top.

For guy derricks straps may be used between block and pin or block attached directly to the pin.

Chain and straps are extra.

Size of Mast Timber, Inches	Diameter of Gudgeon Pin, Inches	Approximate Weight, Pounds	Price, as Shown
8x8	2	155	\$18.50
10x10	2 1/2	165	18.00
12x12	3	195	29.35
14x14	3 1/2	215	36.95
16x16	4	245	52.00
18x18	5	280	73.95

Arranged for stiff-leg and guy derricks same as cuts shown at bottom of page for No. 720 top.

No. 725 Mast Top

For Hand Power Derricks

Including Gudgeon Pin and Collar Straps to Mast with bolts. Eye-bolt for Boom Block and two Sheaves with Shafts.

Suitable for either guy or stiff-leg type of derrick.

For guy derricks, use strapped sheaves. For stiff-leg derricks, use chain arrangements same as shown for No. 720 Mast Top.

One sheave is larger than the other, permitting the two lines to hand winch, placed usually at the back of the mast, to pass to the drums without interference.

Size of Mast Timber, Inches	Diam. Gudgeon Pin, Inches	Approx. Weight, Pounds	Price with Plain Sheaves	Price with Self-Lubricating Sheaves

Channon Derrick Irons (Mast Bottoms)

No. 749 Mast Bottom and Step With Center Pintle

For power guy and stiff-leg derricks where the ropes lead down through the center of the mast-using mast sheave sets Nos. 768 or 769 or No. 845 sheaves with boxes.

Prices include Mast Bottom with plates and pin for Boom, Mast step with bracket, pin, sheaves and necessary bolts.

Use with Mast Top having Gudgeon Pin in Center

Channon Derrick Irons (Forgings)

No. 805. Top Stiff-Leg or Goose Neck Irons

Hammered Steel

Forged from machine steel with bend a short distance from gudgeon pin hole. Washer plate and bolts are included.

Plate for gudgeon pin is punched and worked out—an unusually strong construction.

Forty-five degree bends always furnished unless otherwise notified, but can furnish any bend desired.

We list standard sizes of irons below such as usually supplied with timbers mentioned. Can supply any size irons desired at short notice. Swedes Iron goose-necks at extra price.

Size of Stiff-Leg Timbers, Inches	Diameter of Gudgeon Pin, Inches	Main Iron		Size of Washer Iron, Inches	Diameter of Bolts, Inches	Approx. Weight, Each as Shown	Price of One Iron, as Shown with Bolts

Angle Steel Mast Sheaves
With Shafts, Plates and Bolts

Used with mast bottoms having center pintle to lead the ropes down through the center of the mast to the sheaves in the mast step.

This arrangement used for grab bucket work with rooster top—the two larger sheaves carrying the two bucket lines.

The smaller sheave in regular two line derricks guides the boom line to the large lower sheave as shown in No. 768 arrangement above.

Furnished with self-lubricating graphite bronze bushed sheaves, which require no oil.

No. 787 Split Band

With Extension Straps

Same as No. 790 except with straps extended and including bolts for boom.

Size No.	Inside Diam., Inches	Size of Iron	Weight, Lbs.	Price Each
1	8	$\frac{3}{8} \times 2 \frac{1}{2}$	46	\$21.15
2	9	$\frac{3}{8} \times 2 \frac{1}{2}$	48	22.90
3	10	$\frac{3}{8} \times 3$	67	26.40
4	12	$1 \times 3 \frac{1}{2}$	117	30.00
5	14	$1 \frac{1}{4} \times 4$	175	34.70

No. 772 Boom End

With plates, strops, sheaves, shafts and bolts.

Price includes fittings as shown with two sheaves in the boom bail.

A good strong arrangement.

Price does not include lower block (dotted).

Size of Boom Timber	Diam. of Sheaves	Wght., Lbs.	With Plain Bored Sheaves	With Self-Lubricating Sheaves
8x 8	12	190	\$39.60	\$ 47.50
10x10	14	250	46.00	55.45
12x12	16	385	53.35	63.00
14x14	18	495	63.35	76.55
16x16	20	650	82.00	100.00

No. 774 Boom End

Price includes two sheaves in boom bail and bolts.

Size of Boom Timber	Diam. of Sheaves	Wght., Lbs.	With Plain Bored Sheaves	With Self-Lubricating Sheaves
8x 8	12	185	\$39.60	\$ 47.50

16x16	20	215	$\frac{3}{4} \times 8$	17.00	21.00

Channon Derrick Irons (Mast Bottoms)

The improved derrick irons are of the ball and socket type with oil reservoir and gib or locking steel keys to prevent mast from unstopping or "kicking out."

The bearing surfaces in this type are always in contact—even with the mast out of plumb.

No. 600 Mast Step

With Self-Lubricating Sheaves

Adapted for guy or stiff-leg derricks—without change.

Has gibs or locking keys.

Price includes mast step, as shown with two sheaves, pin, gib keys and necessary bolts.

No. 640 Mast Bottom

Used with No. 600 step. Illustration shows center pintle type. Off-set pintle furnished at the same price.

Price includes mast bottom (no step or sheaves), boom plates (not shown) and pin for boom.

No. 670 Mast Step

With Self-Lubricating Sheaves

Adapted for barge or traveling derricks. No. 640 mast bottom fits this step. Sheaves and pin are above the deck and easily taken out.

Price includes step casting only with two sheaves and pin.

No. 625—Stone Sled

Size 6 ft. long by 3 ft. wide of 5/16-inch plate reinforced by three 1½ x ¾ steel bands and supplied with pulling chains. Weight 385 lbs. Price.....\$41.00

Stone Tongs

Fig. G626

Fig. G627

Furnished promptly any size or style desired. State opening wanted, capacity and style.

Prices quoted upon request.

The Northfield Slush Mixer

Made especially for slushy-wet mixtures only. It is the best for rapid contract work. Capacity 30 to 60 cubic yards per day, according to conditions. Makes a fine mortar mixer when operated by power at about double the speed of hand turning. Dumps automatically when turned by hand and the best results on slush concrete are obtained by hand turning. Some have used this mixer for plaster with good success. On slush concrete it mixes a big heaping wheelbarrow full of dry materials to the batch. It will turn out a 4 cubic foot batch of slush concrete every minute.

Prices

- Slush (hand) mixer complete with cranks, weight 356 pounds.....\$64.00
- Extra for power attachment with one tight American split steel pulley, extra gear, shafting, etc., all complete to fit either machine, weight 47 pounds.....\$7.50
- Extra for power attachment with one tight and one loose American split steel pulleys and with Roberts patent bushing for the loose pulley, extra gear, shafting, etc., all complete to fit either machine, weight 81 pounds.....\$14.50
- Extra if equipped with patent tilting folding rollers so that one man can wheel mixer about like a two-wheeled freight handler's truck, weight 30 pounds.....\$7.00

The Berlin Six Concrete Mixer

It Does the Work of Six Men.

It will mix from 30 to 90 cubic yards per day, having a capacity of 6 cu. ft. of unmixed material and 4½ cu. ft. of mixed concrete. You can mix the sloppy top dressing with no danger of slopping over as the discharge end is completely closed. It can be trailed from the rear of the wagon which carries your wheelbarrow and other tools. No extra team is required.

Showing Man Shoveling in

"Berlin Six," Showing Discharge Chute Open

Weight 1300 pounds. Price.....\$225.00

The New 1915 Berlin Concrete Mixer

Low Charge—Chain Driven

Showing Discharge Side with Auto-Hood Removed

Showing Charging Side—With Low Down Platform (furnished)

The Low Charge Platform saves all the mechanism of the side-loader, also the weight—an important consideration in a small portable machine which is frequently moved. The frame is "low-down" and the incline but very slight—2 feet 6 inches above ground.

This loading platform is included in price of machine, is made of well seasoned lumber and hinged to the mixer—easily taken off for transportation.

The New Features in Mixer Construction

One. Direct Roller Chain Drive from engine fly wheel shaft to drum of mixer—there is no countershaft and there is only one chain and that is steel roller bushed.

Two. Planetary Reducing Gear and self-adjusting Friction Clutch—speed is reduced internally—grease lubrication.

Three. Discharge Chute automatically locked and easily controllable to allow concrete to flow slowly or quickly as desired.

Four. Chain is steel roller bushed heavy type such as is found on large heavy chain driven machines and not common agricultural link-belted.

Five. Sectional drum sprockets.

Six. "Underslung" Frame construction of 6-inch channel steel making for low charging and easy turning—the wheels are large with wide tires.

Seven. The Gasoline Engine is of exceptionally sturdy construction and designed for the mixer—made in the same shop as the mixer. The cylinder, hopper, bed, main bearing and head—are cast in one piece. The water-cooling hopper is large and of proper shape for good cooling—in addition there are four tubes running through the hopper which assist in perfect cooling. Ignition is of the simple, reliable make and break type with gear-driven, built-in magneto—no batteries needed.

The Hopper-Cooled Gasoline Engine

Starts in coldest weather—it cannot be flooded and there are no batteries to freeze.

An excess of gasoline can be pulled into the cylinder—but as the exhaust valve is below the cylinder, all excess runs through the exhaust valve port, thereby eliminating all trouble from flooding when starting. Dougie lubrication. Dust-proof enclosed crank-case. Gasoline tank in base.

Specifications and Prices

Size Number of Mixer	No. 6	No. 11
Capacity, unmixed material, cubic feet	6	11
Capacity, mixed concrete, cu. ft.	4	7
Capacity, per hour in cu. yds.	5-8	8-11
Price, complete, on trucks:		
With Gasoline Engine, housed	\$405.00	\$735.00
With Steam Engine and Boiler		\$655.00
With Steam Engine only		\$755.00
With Electric Motor	465.00	\$955.00
Without Power with Pulley or Sprocket	280.00	\$335.00
Extra—For Batch Hopper	\$40.00	\$54.00
For Water Meas. Tank	40.00	40.00
For Boilers built for Ohio, Mass., Detroit, Sask., or Alberta Specifications		60.00

Above prices include mounting on low down underslung truck with tongue, also folding charging platform shown, standard charging chute, housing, clutch and Magneto for gasoline engine machines.

The Schaefer Concrete Mixer

This Machine Differs from Other Mixers in Several Important Points

First.—It has a substantial foundation with cast frame members, machined joints and turned bolts of large size. This is the same style of frame used on contractors' hoisting engines and has four times the sectional area of the ordinary channel or I beam construction and much less vibration.

This frame is machined carefully for engine cylinders and bearings—keeping all parts in absolute alignment.

Second.—This is the only mixer that we know of using a horizontal steam engine. The engine is really a part of the mixer frame, as the cylinders and bearings are mounted directly on it.

Third.—The engine is direct connected to drum without the use of a countershaft—as the pinion on the crankshaft meshes directly with the drum gear. The large bore and stroke permit of slow speed and long wear.

Dust cover protects all moving parts of engine, which is furnished with grease cups throughout.

This machine is substantially made with few and simple parts, large shafts and bearings, large rollers and truck wheels. On account of the rigid construction and absence from vibration, will last a long time without replacement of parts

Drum is made of hardest tank steel with rings cast solid of semi-steel turned inside and out. The rings are riveted to the shell which is riveted to flanged heads with rounded corners. A drip ring is fitted in the opening to prevent slopping of contents.

The internal blade disposition forces the materials to the center of the drum—then the lower half of the material passes to the discharge side of the drum and is lifted again by the cups or buckets—if the discharge chute is down the drum is quickly emptied, but if the chute is up the material is thrown to the bottom again.

Roller Path Rings and Rollers

Roller rings or track for rollers are perfectly round—they are turned inside and out. The track rollers are large size with wide treads and large bearings—see dimensions below. Rollers are charcoal iron with deep chill and ground to a true circle. Rollers are keyed to their shafts which revolve in large babbitted bearings fitted with compression grease cups, which force the grease out at the ends of bearings—the best method of lubrication for contract work where cement and other gritty dust fills the air around the mixer.

Steam Mixer on Trucks with Power Side Loader and Automatic Water Tank.

Discharge Chute is controlled by one lever and chute is locked automatically. With the bell crank lever motion an in and down motion is obtained—in, to get into drum as far as possible, and down to get away from the inside wings—mixer is discharged in 10 to 20 seconds, depending upon consistency of material.

Side Loader or power hopper is of the simple pivoted type operated by friction hoisting drum with screw thrust. The hopper throat enters the drum and avoids spilling—throat end is partially enclosed to strengthen it and is provided with deflector plate and breaks up material and avoids clogging of hopper. Jack screws are furnished on hopper side to counteract thrust on one side when raising hopper.

Automatic Water Measuring Tank is really automatic—when once the proper amount of water is adjusted for the day's work—it requires no further attention. The power loader operates a three-way valve—filling, measuring and discharging the proper amount of water.

We carry complete Equipment for Concrete Jobs.

Special Street Paving and Road Building Concrete Mixers

Self-Propelling with End Loading Bucket

Fig. G. Showing No. 14 Special Paving and Road Building Mixer with 20 Ft. Delivery Boom and Bucket

This mixer was especially designed for laying concrete footings for streets and roads, but it can be used for any class of work. The machine is mounted to discharge at the rear and is provided with traction drive for moving it along the streets when laying base, enabling it to be always kept at the exact location for most rapid work with least handling or hauling of material. This enables the supply piles to be made continuous along the sides of the street and the mixer placed in the center between the piles and moved along as condition require, to always keep it in most convenient position to the supply of material and delivery of concrete.

No platforms or runways are required and if the material is placed sufficiently close to the machine it can be shoveled directly from the supply piles to the charging bucket, eliminating the use of wheelbarrows at the charging end.

The reversible traction drive is fitted with a friction clutch. In order to move the machine a few feet ahead it is only necessary to throw in the clutch. To stop the machine, throw out the clutch.

The traction drive is connected to both rear wheels, and the drive is sufficiently powerful to propel the machine up a considerable grade.

Provision is made for steering the machine while moving it by its power.

The delivery boom and bucket is a great time and labor saver. It is the most economical means of spreading the concrete on wide streets or roads, eliminating the use of wheelbarrows or carts. One man attends to discharging the concrete and delivering it.

The concrete is discharged from the mixer into a bucket which travels on an I-beam track which is connected to the frame by a universal joint, allowing it to swing from one side to the other in an arc of 180 degrees.

The bucket holds a full batch of the mixing drum, although contractors have found it advisable to make two trips of the bucket for each batch, which can be usually done in the time required to load the charging bucket.

The bucket is operated by power transmitted from the main drum gear to a reversible sheave drum around which a cable is passed and which is attached to both ends of the bucket trolley. One workman operates both the discharge of the drum and the movement of the bucket and the bucket is so designed that it practically spreads the concrete on the street on its return from the end of the beam to the drum of the mixer.

Concrete Hoist Tower Equipment

For Gravity Concrete Distributing Systems

This hoist power arrangement, combined with a system of spouting, comprises a complete, flexible and economical plant for pouring concrete into forms.

Concrete is discharged from the mixer into the hoist bucket, which travels in guides inside the hoist tower and is automatically dumped into the receiving hopper, from which it travels through lines of spouting into the forms.

By this system concrete is placed just where desired with the fewest number of men and in the shortest possible time.

Towers are usually built of wood for ordinary conditions and the size of timbers will depend upon the height and size of equipment used.

4x4 guides should be used to fit channel guides of bucket and the top sheaves should be placed at least 10 feet above hopper bracket.

Towers must be securely guyed at the top and at the distributing hopper and for very high towers at intermediate points.

Complete Tower Outfit consists of hoist bucket, receiving hopper, one set top and bottom sheaves, necessary wire rope for hoisting and guylines, also clips, thimbles and turnbuckles and spout to suit requirements.

Concrete Hoist Bucket

This bucket is rigid in construction and will stand rough usage.

The channel steel guides are flared at the ends and run entire length of the frame.

The roller casters in front also tends to guide the bucket better and reduces friction.

Cap. Cu. Ft.	Hght. Over- all Ft. In.	Lgth. Over- all Ft. In.	Width. Betw. Guides Ft. In.	H. P. 60 ft. per Min.	Wght. Lbs.	Price Each

56 feet long, No. 12 gauge, trussed bottom, top and sides.....	210.00

We also supply Concrete Buckets, Cars, Wheelbarrows, Shovels, Etc.

The Improved Economy Bag Baler

For Bundling Empty Cement or Plaster Bags

To count and bundle empty sacks for return to the mill is a nuisance and a disagreeable job that every cement dealer and contractor has to contend with.

To properly count and bundle sacks is a very important operation because it can be a source of direct loss, if the work is improperly done.

You want credit for every good cement or plaster sack you return to the manufacturer. In order to expect this credit it is necessary to comply with the regulations of the railroads in bundling, and to be sure that you have an accurate count.

This sack baler will pay for itself in increased credits allowed in a short time. It will count your sacks accurately and bundle them perfectly. It enables you to return the sacks quickly and receive credit for them, instead of permitting a large quantity to accumulate.

Has an automatic counting device which accurately counts all sacks up to fifty. When fifty sacks have been placed on the table a bell rings. The counter is also equipped with a locking device, which makes it possible to place a small number of sacks on the table, representing a return from some small customer. The dial always indicates the number on the table.

Price of Improved Economy baler \$25.00

The Century Bag Cleaner

A quick, easy and efficient machine for cleaning and counting empty bags. Is simple in construction, and well built from the best of material. It is light and self-contained so that it can be easily moved from one job to another. All bearings and working parts are located so that they can be oiled, and the cement cannot get into them. It is furnished for hand or power, and with or without counter. The hand machine does not run hard, but, of course, will not clean as fast as the power machine. The power machine is a better proposition for continuous use, as it requires so little power to operate it.

It is estimated that from 6 to 10 ounces of cement is retained in each empty bag. Figuring only 4 ounces in each sack shaken by hand experts state that approximately eight hundred thousand bags of cement return to the mills or is wasted each year. The Century cleaner not only saves this waste but it saves freight by reducing the weight of bags returned. It saves labor, as one man can thoroughly clean more bags in this way than several men can shake poorly by hand.

Each sack is counted as it is taken off automatically, and a bell is set to ring for every fifty for bundling so that there can be no mistake in the count. A tabulating counter carries totals up to ten thousand when it repeats.

Shaking bags by hand is a slow, expensive operation, and injurious to the health. It is difficult to get a good reliable man to do it, and a few hundred bags poorly done is a day's work. Any ordinary man or a boy can thoroughly clean several thousand bags on a Century machine, and you know that the count is right.

Contractors' Portable Material Elevators

Fig. G. Showing overhead horse, with top sheaves, which sets on top of the building, also shows the two cages in position with lower sheaves between them.

Will Supply Material for 100 Masons

We furnish cages fitted for wire guides or wooden guides, as desired, at same price.

This is a complete double cage outfit for the elevation of brick, mortar, etc., in high buildings; as the cages run at a high rate of speed, distance to be elevated does not materially lessen the capacity. Can be operated by horses or by reversible power hoist.

Two cages are used, so that one cage, with its wheelbarrow, etc., balances the other, leaving only the weight of the material to be hoisted by the engine or horse. When one cage is going up, the other is always coming down—one cage is always in position to be loaded while the other is being unloaded. The cages may be stopped at any point.

Wire hoisting rope is provided for as many stories as ordered; the extra rope not used is wound on drum, shown at the top of each cage. The hoisting rope is endless with the ends of the rope attached to the tops of the two cages. From the top of one cage, the rope passes up and around one of the top sheaves, down to one of the bottom sheaves, back to sheave on engine around which it is wrapped two or three times—then back to the other bottom sheave and up to and around the other top sheave then down to top of other cage. Where hoist is used, it can be set 15 to 25 ft. away—but when horse operated, the snatch block must be set as far away from the bottom sheaves, as the height of vertical travel.

The head of the elevator or overhead "horse" supporting the upper sheaves, is made of hard pine strongly trussed and braced by angle iron legs and braces. Safety stops or ratchets and pawls are provided, which hold the load safely at any point.

The cages are all steel construction with the exception of the platform or floor which is hard wood and 4 ft. wide by 6 ft. The distance between guides is 52 in. The distance between floor of cage and underside of cross-beam is 48 in.

Cages, unless otherwise ordered are fitted for wire guides on account of greater convenience in moving from floor to floor; eccentric tighteners are furnished for the wire guides.

Cages arranged for 2x4 wooden guides furnished at same price, but 2x4 guides are not included.

Outfit complete for 50 ft. travel including overhead horse with two large top sheaves and safety stops, two cages with drums, one set of bottom sheaves, 275 ft. $\frac{1}{2}$ in., 6x19 Reliance Swedes Iron Elevator Hoisting Cable, but without guides, weight about 2100 lbs. Price.....\$160.00

Extras—Hoisting Cable, add for each additional 10 ft. of travel..... 1.75

Guides are extra:

$\frac{3}{8}$ diam. 6x7 Galv. Wire Guide Ropes (4 ft. required for each foot of vertical travel), $2\frac{1}{2}$ ¢ a foot.

2x4 Wooden Guides, pine, spliced and bolted per lineal ft. 18¢.

For horse operation including Snatch Block, extra Hoisting Cable and Space Horse Clamp... \$22.00

Single Cages only are sometimes furnished. Price, Cage only..... 47.00

Note—In estimating length of guides be sure to include the distance from top landing to top of horse, also remember that four guides are needed for every outfit.

Channon-Mundy 4 H. P. Friction Drum Gasoline Hoists

A Portable Hoist for All-around Work

Adapted for Hoisting Single Cage Elevators, Pile Driving, Silo and Chimney Construction

This hoist was originally designed for handling the single cage material elevator described below and has a hoisting capacity of 1000 pounds at a speed of 100 feet per minute; it is equally well adapted for general hoisting within its capacity, such as pile driving with drop hammers weighing from 500 to 800 pounds, hoisting small concrete buckets in silo and chimney construction, etc.

The outfit is a self contained, portable unit, consisting of a Mundy power hoist with cone friction drum direct connected by gearing to a four horse power, up-to-date hopper cooled gasoline engine, all complete and ready to run. Engine is extremely simple and easy to start and operate. Fuel tank capacity is $7\frac{1}{2}$ gallons; hopper capacity, 9 gallons.

Equipped with turned and polished winch head on pinion shaft, 7 inches in diameter by 8 inches long, and $10\frac{1}{2}$ inches in diameter at ends; this winch head is used for hoisting piles when pile driving.

The drum is 8 inches in diameter by 16 inches long with flanges $4\frac{1}{2}$ inches high; drum will hold about 1,000 feet of $\frac{3}{8}$ -inch cable or 150 feet of 1-inch Manila rope. Hoist is geared 7 to 1. Drum has foot brakes, ratchets and pawl and screw thrust.

Approximate weight, 3,100 pounds.

Price.....\$535.00

Single Cage Material Elevators

Where it is necessary to deliver material to several floors, the use of the single cage elevator has been found advantageous.

With a double cage elevator, one cage is always going up while the other is going down, consequently when one cage is stopped at an intermediate floor, the other cage remains suspended in the hatchway and can not be used.

The cage shown in illustration is the same as furnished with our double cage outfits and is of all steel construction except the hardwood platform which is 4x6 feet. Made for either wire or 2x4 wooden guides.

Price, cage only.....\$65.00

Single Elevator Cage

Builder's Reversible Gasoline Hoists

With Sheave Wheels for Operating Double Cage Material Elevators

Fig. 2183

The sheave for elevator cable is 12 inches diameter and when engine is run at normal speed, the elevator platforms have a speed of 150 feet per minute. The drum for direct hoisting will hold about 700 feet of $\frac{1}{2}$ wire rope; this drum can be run independently of the cable sheave and makes a valuable addition to the outfit. The gears are 3-pitch with $3\frac{1}{2}$ -inch face.

The entire outfit is built in a very substantial manner, bearings are liberal and babbitted with best babbitt metal. The clutch and main shafts are 2-inch diameter. Hoist is provided with reverse clutch mechanism and foot-brake with ratchet.

The engine is of the Hopper Cooled Type, with gasoline supply in base, and is furnished with all fittings, such as Batteries, Muffler, Spark Coil, Wrenches, Oil Can, Oilers, etc.

Straight Side Mining Buckets

These buckets are largely used in lead and zinc districts. They are similar to Nos. 134 to 141 shown above, except that they are smaller in diameter and longer.

Used also as coal buckets by railroads and as caisson and concrete buckets by contractors. Strong and well made, side catch and gravity dump.

Class B Contractors' Dumping Buckets

For handling Concrete, Mortar, Stone, Sand, etc.,

These buckets are self-dumping and self-righting. Dumping is made automatic by so shaping and balancing the body that it is top-heavy when filled and bottom-heavy when empty. When the catch is released the bucket automatically dumps—after dumping it rights and locks itself.

Buckets are strongly made, bail, trip, stops, etc., are all heavy forgings to withstand hard usage.

Self-Dumping and Self-Righting Buckets

With Flaring Side

The top of the bucket is from 8 to 10 inches wider than the bottom, which permits it to be rapidly filled and quickly and cleanly dumped.

Simple in construction and easily handled. Well adapted for sinking shafts, sewers, etc.

"Unionlock" Automatic Buckets

A Two Line Bucket Largely Used for Depositing Concrete Under Water

A controllable bucket by which a large mass may be dumped quickly or in a thin stream as desired. It has no spring catches or locks. Handled by the hoisting engineer.

This hingeless bucket with its self-adjusting doors leaves no opening between the doors to let the grout waste out. It is automatically tight and the sliding doors keep it so. The bail links draw the door tightly together. The doors are cleaned on the edges of the bucket.

Built substantially throughout—no castings.

Stuebner Controllable Concrete Bucket

Central Discharge

This bucket was especially designed for placing concrete into narrow forms—bucket is furnished with a device to regulate the drop of the bottom doors, permitting the latter to be opened up to widths of 4 to 18 inches.

Makes an ideal spreader for floor slabs.

Operating mechanism is very powerful—making it possible to dump a portion of the load and check the flow of the remainder.

Excelsior Bottom Dump Concrete Bucket

Tilting Bottom, Dump-Clean Discharge

The original and best known bottom dump concrete bucket.

An upward pull on the handle bar dumps the bottom as shown and discharges contents—a downward pull quickly closes and locks it in place until again released.

Contents are deposited in a circular pile without scattering a portion of the charge.

Fig. G572

Hand Power Outfits

Where there are only a few holes to sink, hand power outfits are sometimes used. They consist of a wooden tripod, to two legs of which are attached a drum with shaft and boxes, somewhat similar to our No. 27 derrick. Price, iron work only.....\$53.00

Canvas Tripod Covers

Made of any weight of canvas desired.
Price on application.

Bullock Steel Caisson Rope

For operating power winches.
3/8" diameter, per foot.....\$0.20

Our Champion Hawserlaid manila rope (with the red strand trade mark) has been found to give the greatest satisfaction on caisson work. This rope consists of three three strand ropes laid together, making nine strands in all and twisted very hard.

Sizes 3/4-inch and larger, per pound.....\$0.20

Channon New Style Cargo Hoisters or Caisson Blocks

These blocks have swivel hooks, are galvanized and have wooden projecting cheek sheaves, self-lubricating graphite, bronze bushed.

No. 32. 7 1/2-inch shell, for 1-inch rope.....\$ 8.40

No. 33. 8 1/2-inch shell, for 1 1/4-inch rope.....\$10.65

No. 34. 10-inch shell, for 1 3/4-inch rope.....\$14.00

No. 35. 11 1/2-inch shell, for 1 3/4-inch rope.....\$17.35

Chicago Caisson Equipment

Fig. G571

Caisson Sheave and Winch Head

Used in sinking deep shafts, foundation holes or caissons, for large buildings. These shafts are usually 4 to 12 feet in diameter and sunk to bed rock, then filled with concrete. The shafts are lined with wood lagging supported by steel split rings. The men and materials are lowered and hoisted by means of a bucket attached to a manila rope which is wrapped around the winch head shown in cut.

Power is supplied through an endless wire rope which is wrapped two or three times around the sheave, which revolves constantly. A number of these outfits are operated at one time over a line of holes by a hoisting engine at one end.

Price of turned winch head with shaft and sheave, as shown in Fig. G, 571, above.....\$20.00

Steel Caisson Rings

These rings are made in two pieces bent to a circle, of any size iron and in usual diameters of 4 to 12 feet. Per lb.....\$0.06

Caisson Bucket Hooks

Price, as shown, each.....\$2.00

Caisson Buckets

These buckets are the approved type and size used on all caisson work in Chicago.

They are made of galvanized iron with riveted and soldered seams, making them water tight. They have three iron bands and center swing bail.

Price each.....\$20.00

Hayward "Standard" Orange-peel Buckets

Four Blades

Requires two operating lines, one for closing and digging, the other for holding when automatically discharging.

All parts are interchangeable.

Closed

Open

This popular type is adapted for all classes of dredging, excavating or digging material from its natural state as well as for rehandling of materials and will withstand the most severe usage.

Every part is interchangeable and replaceable and all wearing parts are furnished with replaceable bronze bushings. The materials are of the best quality. The blades and blade arms are of flanged steel and the connecting rods are forged from a solid bar of steel.

This Hayward Orange-Peel bucket is constructed with four curved triangular blades and when closed tight forms a tight semi-spherical bowl, which contains the excavated material.

When open, the blades resemble sharp spades, and are so adjusted that the maximum digging effect is produced, with but a slight tendency to lift the bucket while closing.

Horizontal arms are riveted to the blades, and their inner ends are bolted to a central block or casting, while the outer ends are hinged to the vertical connecting rods, which are pivoted at their upper ends to the upper center block or casting.

The power wheel for closing the bucket is secured to the lower center casting, and is eccentric in shape, so that it gives its maximum power just as the bucket commences to close. It is well braced and the shaft is extended on either side to receive the cams, to which are attached the two flat power chains. An idler sheave is attached to the upper casting to deflect the closing rope, the holding rope being attached to the upper casting on the opposite side.

All bolts and pins are of Norway iron. The standard blades for all buckets have removable cast-steel points, which add greatly to the life of the blades.

A new feature is the oscillating head, which allows the bucket to hang central under all conditions.

Power wheels are now furnished for wire rope; chain power wheels furnished when ordered.

Outside power wheel shaft bearings are used on all buckets 21 cu. ft. capacity and larger. The outside cutting points or shoes are replaceable at small cost. Inside points furnished when ordered.

Hayward Dwarf and Hand Power Orange-Peel Buckets

3 and 4 Blade

These little buckets are largely used by bridge contractors, etc., in sinking steel cylinders for foundations, also used for sinking pipes, digging and cleaning wells and removing obstructions where quarters are cramped.

They operate exactly like the larger orange-peels and will dig almost any material. Of course, the harder the material the less it will fill, but in time it will reach the desired depth which is only limited by the length of the operating ropes.

Hayward Extra Heavy Standard Orange-Peel Buckets

This bucket is constructed along the same general lines as the "Standard" type, but its parts are built heavier and stronger throughout. Both blades and blade arms are made from heavier plate, while the solid forged steel connecting rods are very substantial, heavy members. The sizes of bolts, bushings, etc., are also larger to withstand the rough work that this bucket is designed to do.

The lower center is made of crucible cast steel. The blade points or shoes are also cast steel of the outside type. Inside points if desired.

Hayward Three-Sided Orange-Peel Buckets

This bucket has three blades and is very powerful. For use where boulders, broken rock and other hard odd-shaped material is to be dug or handled. The three blade points either force the material inside the bowl, or, if the material has uneven surfaces grasp and hold it positively to assure quick handling. The blade arms extend lower into the bowl and are fitted with braces—eliminating all side strains.

Hayward Class "E" Clam-shell Buckets

Open

Closed

Latest Improved Type—with "Ore Bowls" and Flat Side Chains

This is the most popular clam-shell and while this type, like all clam-shells, is essentially a rehandling bucket for loose materials, such as coal, sand gravel and crushed stone, when equipped with digging teeth will dig successfully materials such as sandy loam, light clays, etc.

The teeth furnished are in one piece for each side of bucket—one side interlocks with the other.

The Class E Bucket has a wide opening, shallow, tray-like shell or bowl resembling a shovel which allows the material to slide more easily into the bucket while closing. In proportion to size these buckets carry larger loads and are built to handle harder materials, such as crushed stone, broken slag, packed sand and ore. This type is now equipped with heavy, reinforced, bronze-bushed steel bearings on the ends of the blade arms also have manganese steel oscillating idler sheaves and shrouds—making the closing rope longer last than on any other bucket on the market.

The Hayward type of Clam-shell Bucket is made of two shells, or blades. Vertical arms are riveted on either side of the blades, and their upper ends are connected to the main shaft on which the power wheel for closing the bucket is located. The outer ends of the blades are fitted with lugs which receive vertical connecting rods, which are pivoted at their upper ends to the upper center block or casting. The power wheel and cams are made of one casting.

The upper center casting is so constructed that the four connecting rods work from one center, allowing the casting to oscillate and the bucket to hang central under all conditions. An idler sheave is attached to the upper casting to deflect the closing rope, the holding rope being attached to the upper casting on the opposite side.

The materials used are of the best quality. The blades and blade arms are of flange steel, the upper center and power wheel are substantial castings, the connecting rods are of steel, and all bolts and pins are of Norway iron.

All similar sections and parts of the buckets are interchangeable, and are made on the duplicate part system and are bushed throughout with phosphor-bronze bushings, which can be replaced, when worn, without the aid of a mechanic.

The shoes are made of plate steel so constructed that they form a shoulder on either side of the blades. They are riveted to the blades and may be easily replaced when worn.

Power wheels are now furnished for wire rope—chain power wheels furnished when ordered.

Hayward Class "C" Clam Shell Buckets

With Round Bowl and Round Link Side Chains

This is the lightest clam-shell bucket we have—it is supplied with round link side-chains and is designed primarily for handling coal, also other classes of light, loose materials.

Plate steel shoes cover the cutting edge of the bowl—the ends being turned up and riveted to the sides. **Made to order only.**

Hayward Class "E" Clam Shell Buckets: Regular Bowls

Built for handling coal, sand and other loose materials. The connecting rods are reinforced and the blades braced in such a manner that it is impossible for the latter to spread. The steel plate shoes now extend from the top of the bowl on one side to the top on the other.

Flat link side chains give the bucket equal closing or gripping power from start to finish of the closing operation.

Standard Type—1 to 5 yds.

CLASS M
Light Type—Cap. ¾ to 2 yds.

CLASS H
Heavy Type—1 to 6 yds.

Description of Different Classes

Class L.—For handling light material that can be excavated without plowing. Hoisting bail of bar steel—chain pulling bail. These buckets not supplied with teeth. Tank steel cutting edge.

Class M.—Same as Class L, but with manganese steel cutting edges and cast steel trunnions fitted with non-rotating pins and steel bushings for all pin holes—thus greatly increasing the life of the bucket. Can be used for handling sand, crushed stone, etc. Not supplied with teeth.

Class S.—The standard stock bucket is fully described at top of this page.

Class C.—Similar to Class S, except that a heavier manganese cutting edge is used, adding greatly to the life of the bucket when excavating material containing boulders or hard pan. Furnished with two-part teeth and chain hoisting and pulling bails.

Class H.—Buckets are recommended for excavating the hardest materials that a drag-line excavator will handle. Used for excavating hard-pan, cemented gravel, boulders and blasted rock, and, in this service, they hold their shape and do not show excessive wear. A very heavy manganese steel cutting edge is used—all pin holes are steel bushed. Trunnion and loading chain pins are non-rotating. Steel castings are used for making loading chain connections. Furnished with standard two-part teeth and chain hoisting bails.

Capacity in Cubic Yards	¾	1	1½	2	2½	3	3½	4	4½	5	6
Class L, weight, pounds	1,450	1,500	1,700	2,000	3,000						
Class L, Price, each	\$495	\$535	\$573	\$610	\$750						
Class M, weight, pounds	1,650	1,750	2,000	2,300	3,500						
Class M, Price, each	\$555	\$588	\$634	\$688	\$828						
Class C, weight, pounds	3,500	4,000	4,500	6,000	7,000	7,500	8,000	8,600	9,100	9,600	
Class C, Price, each	\$800	\$875	\$935	\$1,094	\$1,250	\$1,407	\$1,563	\$1,688	\$1,813	\$1,938	
Class H, weight, pounds	4,800	5,500	5,900	7,100	8,800	9,400	9,900	10,500	11,500	12,800	15,200
Class H, Price, each	\$938	\$1,032	\$1,125	\$1,407	\$1,563	\$1,688	\$1,813	\$1,938	\$2,063	\$2,188	\$2,438

Prices of Class C and H include standard two part teeth with base of carbon steel and removable point of Manganese steel.

Derricks and Excavators for use with scraper buckets quoted upon request

Locomotive Cranes

**Standard 60 ton steel Erecting Crane with 50-foot Boom—self propelling.
All Castings of steel—Air Controlled Frictions—Pile Driver attachments.
This machine is fast displacing the old style Derrick Car.**

Capacities of Standard Locomotive Cranes

Built in sizes 5, 12, 15, 20, 25, 30, 40 and 60 tons capacity with four or 8-wheeled trucks, self-propelling, using steam, electric or gasoline power, with any style or length of boom to operate pile hammers, grab buckets, drag buckets as well as any hoisting work within capacity.

Wrecking Cranes

Wreckers built in 75, 100, 120, 150 and 160 tons capacity—these may also be fitted with long booms for erection purposes.

General Description of 60-Ton Steel Erecting Crane

Developed to meet the demand for a crane to handle quickly large ungainly units, such as bridge trusses or even complete bridges of moderate size—they are also used where unusual height is required, special booms up to 137 feet having been provided.

Mechanically they have many desirable features. Every important casting is of steel. The clutches for the motions of hoisting, slewing, traveling and varying the boom radius are operated by air cylinders controlled by valves, giving ease and speed of operation. Operating valves, together with the hand levers and brakes, are conveniently placed directly in front of the operator, whose position is so located that he has unobstructed view of the work at all times.

Two slewing speeds are provided for light or heavy work, controlled by a steel clutch that is always in either high or low speed. Slewing is accomplished without reversing the engines, by a train of cut spur and worm gearing, operated by friction clutches.

There are five provisions for hoisting or holding the load—the main hoist, an auxiliary hoist for handling light loads with a single line—the boom hoist, and two independent winch heads, one on each side of the crane.

Both the main and auxiliary hoists have extra large friction clutches and hoisting drums of large capacity. On the main hoist there is a screw brake of ample size to handle the maximum loads—auxiliary hoist is controlled by a quick acting foot brake. The mechanism for varying the boom radius is controlled by a steel clutch and automatic brake—due to the use of the improved Hindley worm, running in an oil tight case—the boom may be raised or lowered with the full load suspended.

The engines are double—accurately finished and of ample capacity. Link motion is provided for reversing. Bearings are of very large size with replaceable bronze bushings—those for the main shaft are placed on the outside of the frames so as to be readily accessible.

Gearing is of steel or bronze throughout—all being accurately machine cut. Large powerful friction clutches of a superior type with friction surfaces of special asbestos composition are used and adjustments and replacements are simple matters.

Complete provision is made for adequate lubrication below the car body as well as above. Convenient oil pipes lead to all bearings not easily reached by the operator; in fact, accessibility of all parts is a feature. Machinery is arranged to facilitate examination and is not too closely crowded together.

The cars, or trucks, fulfill all M. C. R. requirements, as well as those of the Interstate Commerce Commission.

The heavy roller path attached rigidly to the car body is accurately machined to assure perfect alignment and long wear. A hollow steel center pin receives the unbalanced tension due to load, also forming the center of rotation of the superstructure.

The special system of side frames and cross-beams gives the most rigid support to the machinery—doing away with structural material or heavy, flat castings generally used.

For grab bucket work, this machine is the fastest and most reliable in the field—one drum is controlled by free releasing clutch of fast action, the other by an independent cone clutch. Boilers furnished for any inspection desired.

Prices quoted upon request.

No. 565 Skid Excavators

Steel Boom and A Frame

With Clam-Shell or Orange-peel Buckets

An "A" frame steel Skid Machine with bull wheel and standard contractors' engine. We furnish these machines in various sizes to be operated by steam, electricity and gasoline.

This type of machine may be used in three ways. The first, as shown here, is a machine with a bull-wheel, stationary topping lift and automatic bucket.

The second style is made by adding a sheave and substituting a sheave block at the apex of the "A" frame; with this change a variable topping lift may be used.

The third style is when the bull-wheel is entirely eliminated, two swivel blocks are placed on the "A" frame sill, two more on the "A" frame and the lines led to the engine drums, making what is called an automatic or gravity swing, but with this swing material can be discharged on one side only.

This machine can be knocked down and set up more quickly than one built entirely of wood.

All its material is light and comes in smaller pieces, so that it is far easier to handle and transport from one place to another, saving time, money and labor.

The "A" frame and engine can be removed from the platform and placed on a scow, making a **standard type of dredge**.

By adding a few truss rods and extra timbers, the machine can be mounted on wheels, making a **machine of wide gauge**.

Its "A" frame and sill may be mounted on an ordinary flat car and used as a **traveling machine** on a standard gauge road. When so arranged, however, it can only be used on railroad sidings as the "A" frame would project too far to use on main railroad lines.

If the machine is rigged to use a variable topping lift, the bucket may be eliminated, and the machine then used as a **regular derrick**.

The popular size (as shown) will handle a 1-yard Clam-shell or a $\frac{3}{4}$ -yard Orange-peel bucket with a 40 ft. boom.

The Operating Lines.—Instead of being led through a casting at the foot of the mast, as in the usual derrick, in this machine these lines are led from the point of the boom down to the upper part of the mast, under two sheaves, then up and over two sheaves just above the top of the house line and from there back to the engine drums. The lead is direct to the engine drums and not over deflecting sheaves.

The Platform is built entirely of wood fitted with substantial castings and tied with strong rods and bolts. It is mounted on four or more skids (depending upon the size of the machine) and upon which it is moved as the work progresses.

The bull-wheel may be operated by auxiliary swinging drums fitted to the main hoisting engine, but we recommend a separate engine for this purpose. The increase in cost is more than compensated for by the ease with which the machine is then operated.

Fig. G. $1\frac{1}{2}$ yd. Machine, with 60 ft Boom, Digging Gravel and Loading Into Cars.

The Channon Scraper Excavator

Model 08—Wooden Frame

For Digging Waterways, Building Levees, Making Railroad Cuts and Fills, Digging Ore from Open Cut Mines, Loading Cars, Stripping Coal Beds, Digging and Back-Filling Sewers and Trenches, for Use in Gravel and Sand Pits or for Handling Loose Material of any Kind.

Advantages.—Machine rotates in a complete circle, loading and discharging material on both sides, front and rear.

Operates from the ground level and the scraper is pulled toward the machine—digs lower and discharges higher than other types—can be quickly erected and transported—handles large yardage at small cost.

The Channon Scraper Excavator, briefly described, consists of an upper platform or turntable, rotating upon a lower or skid frame, which is moved upon rollers, using planks laid on the ground for runway.

The long boom and machinery are placed on the upper platform which revolves like a locomotive crane on eight or more track wheels, having shafts attached to an outer ring and radiating to a slip ring sliding between the top and bottom center castings, making a perfect roller bearing.

These rollers bear on and travel between two circular T-rail tracks, one attached to the underside of the upper platform, the other to the top of the lower frame. Around the lower rail circle is passed the wire ropes for turning the upper platform, which rotates opposite to and counterweights the bucket and load.

The patented scraper bucket is hauled **toward** the machine, which is moved (by its own power) on the maple rollers **away** from the cut.

As machine rotates in a complete circle, it will, of course, dig and automatically discharge material on any side, as well as front and rear.

All operating levers are banked in quadrant at front of machine, where the engineer has an unobstructed view of the cut. Machines can be operated by two men (engineer and fireman).

Machine will dig economically any material that **can not** be plowed by four horses. The engines and boilers are amply large for even harder digging, but, of course, the capacity is then reduced very materially. We do not recommend our excavator for hard pan, shale clay, cemented gravel or the like, though it will handle such material after it has been blasted.

When writing, be sure to mention size of cut, character of material and general conditions of the work.

Send for catalog 37 giving complete description.

The Channon Scraper Excavator—(Continued)

Or "Drag-Line" Scraper

The first revolving derrick excavator with the scraper type of bucket was placed on the market by this company in 1904—its success was immediate and since then hundreds of these machines have been built.

This machine is especially adapted for digging economically canals or waterways and through cut work of any description, wasting the material on one or both sides. Its freedom from complicated parts, ease of handling and transportation makes it a desirable machine for general work as well as for large contracts.

It is readily adapted to many changes. It can be used as a pile driver by suspending a pair of leaders from the point of the boom—by detaching the bucket and adding a fall block. It makes the finest kind of a rotary derrick—for very deep foundations, excavations or for loading material out of cars—it will handle perfectly a clam-shell or orange-peel bucket. Other particulars will be found in Catalog 37 covering this machine.

General Specifications

1½-yard Machine—the Popular Size

Scraper bucket.....	Capacity 1½ cubic yards
Main engine, special Mundy, with large frictions and gearing.....	9x10 double cylinders, double friction drums
Boiler, vertical, high-pressure, with Jerrold tube setting.....	50-in. diam., 102 ins. high; 155—2-in. diam. tubes
Swinging engine, special Mundy, compound geared.....	5x8 double cylinders, link-rev. motion
Winch, iron frame, screw brake.....	Double purchase
Wire rope, Bullock brand.....	Plough steel
Diameter rail circles, center to center of T-rails.....	13 feet
Boom, length center to center.....	50 feet
Digging radius, from center of machine boom at 30 degrees.....	50 feet
Width of machine.....	14 feet
Length of skid frame.....	22 feet
Length of turntable platform.....	29 feet
Height of "A" frame.....	18 feet
Clearance height under boom point to ground level, boom at 30 degrees.....	30 feet
Clearance height under boom point to ground level, boom at 60 degrees.....	48 feet
Size of load orange-peel or clam-shell bucket will handle in average earth.....	1½ yards
Weight, machinery and ironwork.....	Approximately, 45,000 pounds
Weight, timber.....	Approximately, 46,500 pounds
Weight, complete machine, in running order.....	Approximately, 50 tons
Capacity, in average earth.....	Approximately, 750 yards in ten hours

With a 50-foot boom set at an angle of 30 degrees, machine will dig at any point in a circle, 100 feet in diameter.

1½ yd.—55 ft. Boom Digging and Dumping Into Small Cars

Fig. No. G. Model 1460 Steel Excavator—discharging into hopper

The Channon All-Steel Scraper Excavator

Model 1460 Latest Improved Type

It is a well known fact that a scraper bucket, on account of its scraping action and direct pull, will handle very much harder material than other digging buckets not employing this principle. This feature combined with the use of a long boom revolving in a complete circle accounts for the popularity of this machine.

This machine is the evolution of our Model 08 wooden frame outfit—the principle is the same, but the entire machine is constructed of structural steel. All stresses are concentrated within the swing circle, making a well balanced outfit. It is well designed, properly braced and cover-plated throughout. Made in sections for shipment and easy erection.

The scraper excavator resembles, in a general way, the well known locomotive crane, in having its operating mechanism mounted upon a rotary turntable—the weight of the machinery, etc., counterbalancing the load and the weight of the long boom. It presents, however, many new features in construction, the merits of which have been fully demonstrated under severe service.

The patented scraper bucket is hauled toward the machine, which is moved (by its own power) away from the cut.

As machine rotates in a complete circle it will, of course, dig and discharge material on any side, as well as front and rear.

All operating levers are banked in quadrant at front of machine, where the engineer has an unobstructed view of the cut.

Machine will handle economically material that can not be plowed readily by 6 horses; the engines and boiler are amply large for even harder digging, but, of course, the capacity is then reduced very materially. We do not recommend our excavator for rock, hard pan, shale clay, cemented gravel, or the like, though it will handle such material after it has been blasted.

The excavator is especially adapted for digging economically canals or waterways and through cut work of any description, wasting the material on one or both sides.

Its freedom from complicated parts, ease of handling and transportation make it a desirable machine for general work as well as for large contracts. Our machine has been used successfully in cutting irrigation ditches, building levees, railroad embankments, stripping gravel, coal, ore and phosphate beds and loading the excavated material into cars at a lower cost per yard than with other machines used for the same class of work.

Our Model 1460 Machine is fully described in Catalog No. 427 and No. 430.

Model 1460—All-Steel Scraper Bucket Excavator—(Continued)

General Specifications

1½-yard Machine—the Most Popular Size

Scraper bucket.....	Capacity, 1½ cubic yards
Boom, length.....	60 feet
Main engine, special Mundy, with large frictions and steel gearing.....	9x10 double cylinders, three friction drums
Boiler, high-pressure, locomotive firebox type.....	54 in. x 12 ft. x 3 in.
Swinging engine, special Mundy, compound geared.....	5x8 double cylinders, link-rev. motion
Wire rope, Bullock brand.....	Plough steel
Diameter rail circles, center to center of T-rails.....	14 feet
Digging radius, from center of machine boom at 20 degrees.....	65 feet
Width of machine.....	14 feet, 6 inches
Length of skid frame.....	18 feet
Length of turntable platform.....	28 feet
Height of "A" frame.....	20 feet, 9 inches
Clearance height under boom point to ground level, boom at 20 degrees.....	26 feet
Size of grab bucket will handle, orange-peel.....	1½ yards
Size of grab bucket will handle, clam-shell.....	2 yards
Weight, complete machine, in running order.....	Approximately, 45 tons
Capacity, in average earth.....	Approximately, 50 to 100 yards per hour

With boom set at an angle of about 20 degrees, machine will dig at any point in a circle 130 feet in diameter.

For further particulars, ask for Catalog No. 427.

Model 1460 Steel Excavator with Clam-Shell Bucket—Unloading Scows

Bishop Derrick Excavator

(Patented)

Operated with Two-Drum Engine Having a Swinging Gear,
Dumps by Hand Line, or Automatically, as Desired

Fig. 2169

Can be used with any derrick having a square boom

The range is from the base of the derrick to the end of the boom, and below the base of the derrick the length of the dipper arm used. The ultimate strength of a crowding engine on a shovel is the weight of the boom. This machine has the entire weight of the boom on it at all times when digging.

The operator slacks gently on the digging line drum until the carriage rolls down the boom, bringing the shovel down to the desired position and then releases entirely and the dipper swings back under the boom, the large end of the cam operating the grip and at the same time the operator lowers the boom, thus bringing the entire weight of the boom on the dipper. Should the dipper, however, be too far in to the bank, the boom can be raised and the dipper drawn out after it is full. As the dipper arm raises up, the carriage follows with it.

The carriage is constructed of steel plates and contains four rollers. The end of the dipper stick is provided with a cast-iron eccentric, or cam-shaped shoe, and when the dipper arm is raised toward the boom the pressure is released, permitting the carriage to roll down the boom; but when the dipper arm is released, the large end of the cam presses the lower grip plate against the wire and holds the carriage until the dipper stick has been raised sufficiently, when the small end of the cam releases the grip and the carriage follows up the boom.

Prices of Carriage and Dipper

Size	$\frac{1}{2}$ yard	$\frac{3}{4}$ yard	$\frac{1}{2}$ yard	1 yard
Price	\$1,200.00	\$1,350.00	\$1,500.00	\$1,575.00

Includes manganese steel lip and teeth.

Steel Dipper Dredge
Single Line Type

The single line steel dredge has for more than 10 years been recognized as the most efficient type. This machine can be furnished with sectional steel hull, the sections of which pack so closely that the entire hull can be loaded on one ordinary flat car, and can be quickly assembled at low cost. The dredge is equipped with wide range spuds and hollow steel dipper handle.

Furnished with dippers ranging in capacity from 1 to $2\frac{1}{2}$ cubic yards. The length of boom usually ranges from 35 to 70 feet.

The main hoisting engine is of heavy design, fitted with compound gears and actuated by means of a substantial band brake. The swinging engine is of the central valve reversing type, compound geared, the gearing of both engines being of the highest grade steel. The hull, "A" frame, spuds, boom and circle and the dipper handle are of steel and steel sheaves of liberal size and strength are provided. By reason of these features this form of dredge is highly popular with experimental extractors.

Revolving Steam Shovel
Single Line Type

This machine employs a simple single cable, double cylinder, horizontal, compound geared, link reversing hoist, fitted with outside band friction and steel gears, also a rotating as well as a crowding engine of the same reliable design.

The boiler is of the vertical type, of ample size and power and designed for 145 pounds working pressure.

The boom is of all steel construction and the fittings are of heavy cast steel.

The dipper handle is our new welded design of hollow steel construction. The foot castings are of steel and rigidly secured to the dipper and the racking is of steel cast in a single section. The dipper is extra heavy, designed for hard continuous service, and the pins, bushings and teeth are of manganese steel.

We recommend this shovel for road, street, sewer and trench work, basements, clay deposits and stripping and for sand and gravel pits.

Usually furnished with a $\frac{3}{4}$ -yard bucket.

Drag Line Excavator Equipment

Drag Line Excavators

For rapidity and economy in the digging of bank or bed materials, in the dry or from under water, there is no more satisfactory device than the Dull Improved Drag Line Excavator. It is shovel, conveyor and elevator, all combined in one equipment; and it is operated wholly by one man. Low in first cost and in maintenance expense, economical in wages and power costs for operation, and rapid in direct and dependable delivery of materials, this excavator shows yardage cost so low as to make its use very profitable in many lines of work.

The Dull Drag Line Excavator is extensively used for delivery of materials to sand and gravel washing plants, and many outfits have been furnished in connection with plants of this character—not only with new Dull plants, but also for older plants of other original design. In this work there is often special advantage in the ability of the drag line excavator to dig from below water as readily as in the dry. It is also adapted for carrying the material back into the worked-over excavations.

Method of Operation

The excavator bucket is suspended from a trolley as shown in the illustration, which runs on an inclined wire rope track, extending from the upper end of a mast of proper height—50 to 100 feet—to any suitable anchor—a tree or a "dead man"—out where the materials are to be dug. The inclination must be such that the bucket and trolley will run rapidly and freely down.

Equipped with 1½-Yard Bucket
Capacity 600 Yards—10 Hours

A two-drum hoist operates the excavator. From one drum runs a rope to the top of the mast, where it is reeved through a pair of blocks, one attached to the mast, and the other to the track rope. This is called the "slack line," as it slackens and tightens the track line. The rope from the other drum runs from the block on the mast to the draft chains on the front of the bucket. When the clutch on the drag line drum is released the bucket runs down the trolley, its speed is controlled by a brake at the hoist. Reaching a point over the material to be dug, the track line is lowered by paying out the slack line at the hoist. When the bucket rests on the material the hoist hauls in on the drag line and the bucket picks up its load as dragged forward. Then the slack line is hauled in, raising the track line and lifting the bucket out of the material, to be hauled rapidly up to the track by the drag line.

One and One-Half Yard Bucket

discharge gate which opens when the dump trolley strikes the dump casting on the track line and causes the wire rope connection to lift the gate. Thus the load drops directly out of the rear end of the bucket. The bucket body is of heavy plate steel well fitted and securely riveted. The wearing parts—digging lips and bottom runners—are of the best grade manganese steel. The gate is reinforced with heavy angle iron and bar stiffeners. All prices quoted upon application and buckets furnished to meet your special requirements.

Arrangement of Rear Gate Discharge Bucket,
Style "D"

At the desired dumping point—which may be anywhere along the track line—the dumping trolley ahead of the bucket strikes a stop-casting clamped to the track line. See the illustration above. Then a slight farther movement forward causes the rear dump gate to open and the material to drop out.

This completes the cycle of operation and the bucket then is allowed to run down for another load.

The Rear Gate Discharge Bucket

The Dull Rear Gate Discharge Bucket, while of familiar general form, is a distinct advance over other styles in that it eliminates the delay and power loss involved in the old plan of tipping the bucket for forward charge. The Dull Bucket has a hinged rear-end

"Style D" Improved Bucket

Screens for Washing Sand and Gravel

Dull's Conical Screens and Continuous Inclined Shaft

necessary to get rid of the muddy water. This is done by a conical separator tank.

It will be noticed that all the screens are mounted on one shaft. The object in this arrangement is to dispense with a separate drive for each screen, with the attendant line shafting, bearings, gears, sprockets, chains, etc. One single pair of gears drives all the screens.

It is the large end of the screen that does the principal work. It has more perforations, more wearing surface and is equivalent to a much larger screen of other types. It therefore has greater efficiency, requires less power and has small upkeep expense. The screens have longitudinal joints and can be dismantled without disturbing the shaft. Walkways are also provided on both sides of the screens, to make them accessible.

This type of screen does not require so much timber work for supports, neither does it require so great a height to install. It is made in three different sizes, depending on the capacity required and the nature of the material. The first screen has usually $1\frac{1}{2}$ -inch or $1\frac{3}{4}$ -inch perforations, and all material over this size is discharged through the small end of the screen into the first bin. The washing process now takes place as described above. The second screen usually has $\frac{3}{4}$ -inch perforations and the third screen is made with $\frac{3}{8}$ -inch or $\frac{1}{2}$ -inch perforations, depending upon what class of trade the owner of the plant has, and how coarse he wishes his sand. Pipe nozzles are placed at the discharge end of the screens, for injecting water to prevent the material from discharging too rapidly and carrying over some of the finer parts. This fresh water is a rinsing water also and keeps the material from piling up in the spouts beneath the screens. The sand, water, soils and impurities are discharged from the settling box or tank. The sand settles to the bottom of the tank, and the water, carrying the impurities, passes over the opening at the top of the tank and is carried away by a launder.

Arrangement of Plant Using Dull's Inclined Conical Screens

Jacketed Cylinder Screen

Information Gladly Furnished

Owing to the many various conditions under which these plants must be built, it is impossible to quote any prices in this catalog, but we will gladly furnish any information desired upon receipt of your specifications. In writing for prices kindly give capacity desired, description of material, number of sizes of gravel you wish to grade and size of each grade, amount of impurities, clay, loam, silt, etc.

It is sometimes advisable for plants already built to use the cylinder type of screen, to avoid making extensive changes in framework. The illustration at left shows the Jacketed Cylinder Screen. It has a sand jacket for use in a dry process screening plant.

The illustration below is not a washing screen, but simply a standard type for stone sizing. Built in various styles and sizes.

Stone Screen of Standard Design

Screens for Washing Sand and Gravel—Continued

A Double Set of Inclined Conical Screens

The arrangement of the screens on the shaft is best described by the illustration. It shows a double set of inclined conical screens, with the coarser screen at the top and the finest at the bottom. The walkways and the water system can also be seen. The arrangement of this plant is such that every part can be reached conveniently.

By reason of its important advantages and its conspicuous success in service this type of screen has won foremost rank in sand and gravel washing equipment, and is the standard for all work wherein some other type is not particularly desired or required.

Conical Separator Tank

The Conical Separator Tank is suspended directly from the supporting and operating lever system. At the bottom is an outward-opening valve, attached to a central rod down from the counter-weighted lever beam.

The suspension and connections are such that the weight of sand accumulation in the conical tank, overcoming the counterweight, causing a slight lowering of the tank and a farther lowering of the valve rod, opening the valve to permit escape of sand until reduction of weight causes closing of the valve. The soil water flows away at the top outlet, before which is a baffle plate to assist settlement of the sand, by permitting escape of the water only from below the surface.

The illustration below will best explain the method employed.

Conical Sand Separator

Loading Spouts and Gates

For loading from the bins, gates are provided. These gates are of types best suited to the particular kind of sand and gravel, with spouts hinged for raising and lowering, under control of counterweights. The Segmental Gate, shown in the illustration, is rotated on the same axis as the spout. It is very easy to operate and will not jam. In simple form it is particularly well adapted for use on the gravel bins. For the sand bins special consideration is necessary, and a special design has been constructed which, with toggle operating lever and eccentric action, is easy to operate, closes tightly to prevent leakage, and is self adjusting to allow for wear.

When writing your specifications for the Conical Separator it is necessary to give the capacity and description of material.

Segmental Gate

Regarding Inquiries

We solicit your inquiries relative to complete Sand and Gravel Handling Plants, small or large, and can furnish all the necessary machinery and equipment, including power, such as engines, boilers or motors, crushers, elevators, hoisting engines, pumps, piping, valves, shafting, belting, bearings, etc.

In order to make recommendations and quote prices for the most suitable equipment, we must have information as complete as possible regarding the conditions to be met: we should know the length of the track line span, the size of excavator bucket desired or number of yards required per hour, the number of sizes of sand and gravel wanted, the maximum size boulders in the deposit, and the approximate percentage of oversize gravel exceeding $1\frac{1}{2}$ inches and information relative to water supply, if washing and screening is desired.

The cost and character of a thoroughly satisfactory equipment are dependent upon proper consideration of, and adaptation of these various conditions.

Gasoline Driven Sand and Gravel Dredging Plants

We here illustrate the side elevation and plan of a sand and gravel dredging plant mounted on a scow and driven by a gasoline or kerosene engine, including an auxiliary power piston pump primarily for priming the large dredging pump. The piston also furnishes clear water under pressure to the main bearing of the dredging pump, giving, as nearly as possible, perfect lubrication and at the same time keeping the packing always in good condition.

The piston pump can also be arranged to pump water from the scow. This is accomplished by valves and pipe connections.

The piston pump is driven by a small gasoline engine, usually by means of gears. The same engine is employed to drive a single friction drum belt driven hoist. This hoist is used in connection with a stiff leg derrick for raising and lowering the suction line.

The derrick is also equipped with a single drum derrick winch for raising and lowering the boom.

We can furnish all of the machinery, wire rope, blocks, pipe, hose, etc., to equip an outfit of this kind. We can also furnish the same equipment with electric or steam power, of any size desired.

Dredge Pumps

For Sand and Gravel

Electrically Driven

The illustration shows a 10-inch heavy duty sand and gravel dredging pump direct connected to a 150 H. P. electric motor, the motor being mounted on an extension cast base and connected to pump by means of a flexible coupling.

These units can be furnished with either a constant or variable speed motor and pump of any size desired.

When pumping against high heads we recommend a heavy marine thrust bearing.

When requesting quotations give complete data relative to head, including length of both suction and discharge lines, also information relative to available electric current.

The Union Double Acting Steam Pile Hammer

Operated by steam or air without any changes, operates equally well in fixed leaders or suspended from the boom of a derrick or crane. Requires very little head-room and is extremely simple.

This type of modern double-acting, rapid-fire pile hammer delivers a succession of blows so rapidly that each blow falls before the movement caused by its predecessor has ceased; in this way an effect which is practically continuous is obtained, that the pile may be said to be literally pushed into the ground and when the hammer is stopped, the earth grips the pile firmly and holds it securely and penetration is obtained that would be impossible with a drop hammer, while the fact that the blows do not split or broom wood piles or sheeting, gives it an additional advantage.

The small dimensions of these machines admit of their use where head-room is limited.

Another advantage lies in the fact that this hammer may be suspended under any derrick boom or by chain hoist or tackle of any kind as well as in the ordinary pile driver leads.

Showing Base for Round Piles

Principle of Operation.—On opening the inlet valve or throttle, steam or air is admitted to the lower end of the cylinder, raising the ram to the top of its stroke; a valve actuated by a rod and locking lever then admits the steam or air to the upper end of the cylinder and the lower end being opened to exhaust, the free fall of the hammer is thus accelerated by the pressure on the top of the piston and the force of the blow correspondingly increased. The frame or body is one single casting and forms the cylinder, valve chest and ram guides and encloses the ram and valve mechanism thus protecting them from injury. The safety buffers and pile plate are also within the frame, so that nothing but the steam inlet is exposed. The piston and rod is a solid steel forging, the ram head is of steel and secured to the rod by a taper key; the piston, piston rod and ram head together form the "ram." The ram head moves in guides machined in the frame. Since weight is the chief requirement, all parts are heavy and of more than ample strength and are easily accessible.

All hammers have an automatic by-pass in the cylinder so that they **can not be started** unless they are **landed or resting** on the pile. Hammer is extremely simple, there are **only two bolts** in the entire movable working parts. **Prices** on the No. 4 and larger sizes include base for round piles and jaws for wood sheeting or driving cap for steel sheeting. The round pile base or steel sheeting driving cap for Nos. 2 and 3 hammers are \$75.00 extra including the anvil block.

The No. 7 Hammer is suitable for driving 1-inch wood sheeting; No. 6 for 2 to 3-inch; No. 5 for 2 to 4-inch; No. 4 for 2 to 6 in. wood sheeting, light steel sheeting, light round or square piles. The No. 3 is suitable for minor work, small round or square wood piles, 3 to 6 in. wood sheeting and light steel sheeting. No. 2 for general work, small concrete piles, medium round or square wood piles and sheeting and ordinary steel sheeting. The No. 1 and 2 are adapted for medium and large concrete piles, heavy steel sheeting and large wood piles.

Township or Horse Pile Driver

With this driver the hammer is usually raised by horse-power, although a hand-power winch is sometimes used or a small power hoist with single drum for handling the hammer and a winch head for hoisting the piles into place ready for driving.

The hand winch is bolted to the ladder, but the winch method is very slow and but very little used.

For small bridge work and other light driving, the hammer is more often operated by horse-power—the smaller sizes being hoisted direct, that is without the use of a purchase block. The larger sizes have one end of the line fastened to a suitable post, driven into the ground, while the other end is passed through a tackle block which is fastened to the main hoisting line and leads to the whistle-tree direct.

Tackle blocks can also be used instead of sheaves at top and bottom, on the smaller sizes, when so desired.

Lines and blocks are not included in prices below. For the lines, we use Channon No. 1 Manila rope, 4 strand for the hammer line and 3 strand for the pile line and two side guy lines, two wood snatch blocks generally furnished. The rope sizes range from $\frac{3}{8}$ to $1\frac{1}{2}$ for hammer lines and $\frac{5}{8}$ to 1 inch for the other lines.

***Ironwork Complete**, includes hammer with steel die fitted, nippers without block, two No. 1 top sheaves with shafts, boxes and bolts, channel iron liners with bolts and washers, one pair each Nos. 1 and 2 toggles with bolts.

The woodwork consists of the framing as shown, fastened together with bolts so as to be readily taken down for transportation, with turned ladder rungs, maple rollers, and nipper block. All painted and knocked-down f. o. b. cars, Chicago.

Standard Contractors Pile Driver

This style of gravity drop pile driver is usually operated by a double friction drum hoisting engine, though a single drum engine with a winch head can be used.

We furnish driver with extension sills as shown or with short sills where engine is located away from the driver.

We can furnish either ironwork only, or ironwork and woodwork complete, ready to set up. When a complete outfit is ordered, we assemble the entire leaders in the shop, and when taking apart, mark all joints to facilitate erection in the field. The framework is of Norway pine, head-block of oak or maple, ladder rungs of turned oak, wedged in and rollers of maple; all bolted together, no nails being used. Prices include painting and "knocking down" for shipment and delivery on cars, Chicago.

***Price of Ironwork Complete** includes pile hammer with round steel pin fitted; No. 1 top sheaves with shafts boxes and bolts; No. 3 bottom sheave with shaft, boxes and bolts; one pair each No. 1 and No. 2 toggles with bolts; and channel iron liners with bolts and washers. Lines and blocks quoted upon request.

Prices without Lines, Blocks or Pile Cap.

Weight of Pile Hammer, pounds	Dimensions of Pile Hammer		Height of Leaders, feet	Length of Channel Iron Liners, feet	Price of Ironwork Complete (see above)	Price of Woodwork with Short Sills	Price of Woodwork with Extension Sills as shown	Price of Ironwork and Woodwork Complete with Extension Sills

Use Ajax 4-strand Manila Rope for Hammer Lines.

Drop Pile Hammers

Careful attention has been given to the design of these hammers to concentrate as much weight as possible in the base and to have the hammer as long as the size of the leaders will permit, giving longer bearing in the guides.

Allow $\frac{1}{4}$ -inch play for channel iron liners, that is $\frac{1}{4}$ inch on each side.

We supply two forms of pins, a triangular die or pin for use with nippers for horse or winch drivers and a turned steel pin to which the hoisting line is attached direct when hammer line is operated by a friction drum.

Be sure to specify which is wanted.

Weight of Hammer, Pounds	Distance Between Jaws, Inches	Width of Jaws, Inches	Price of Hammer, Including Steel Pin Fitted
500	13	4 $\frac{1}{4}$	\$25.00
600	13	4 $\frac{1}{4}$	30.00
700	14	4 $\frac{1}{4}$	33.00

2500	19	7 $\frac{1}{4}$	95.00
3000	20	8 $\frac{1}{4}$	100.00

Hammers vary in weight 25 to 100 pounds more or less. Be sure to specify style of pin wanted. Larger sizes to order prices quoted upon request.

W. T. C. Patent Cap

In driving piles with a drop hammer the heads are frequently split or broomed by the concussion of the hammer—to overcome this difficulty, recourse is had to Pile caps.

The expense of taking off and replacing these bands, to say nothing of broken ones and consequent delays led to the adoption of this pile cap which is used by leading contractors and railroads all over the country.

It consists of a cast iron cap with tapered recesses above and below the pile fitting the head of the pile fitting the lower one.

Into the top recess is fitted a turned and painted oak cushion block with Norway iron band $1\frac{1}{2}$ inches at top.

Suitable jaws engage the leaders and form a movable toggle-iron, steadying the pile as it is being driven.

As the hammer descends, it strikes the wood cushion block and the pile is forced downward by the blow.

After the pile is driven, the cap is fastened to the hammer by means of pins on each side and both raised together.

These caps are made to suit dimensions of customer's leaders. We must know width of jaws and also distance between jaws of hammer.

Price, including block, band and pins for pile hammer.....\$60.00

Also furnished for steam hammers and for wooden sheet piling or for all popular makes of steel sheet piling, U. S., Lackawanna, J. & L., etc..... 65.00

No. 3 Follower Band

In some driving there is not room for a cap as described above, so we furnish a wrought iron band tapered single or double flare.

14 in. diameter, 8 in. face... \$22.75
12 in. diameter, 7 in. face... 20.00

State whether single or double flare is desired.

Follower Caps

No. 3

For driving piles below the surface. This cap is recessed at the bottom to fit over the pile. In the upper end a pile of required length is bolted with the upper end trimmed to fit into the regular pile cap.

The No. 4 is similar, but arranged for sheeting.

Price No. 3 A. 12 inch diameter.....\$20.00
Price No. 3 B. 14 inch diameter..... 26.00

Size 8x10. Weight about 22 pounds..... 3.00

Norway Iron Pile Bands

Fitted to the tops of piles for hard driving. The popular size of iron is $\frac{3}{4}$ x3 inch iron, but we make them any size or diameter.

Diameter, inches. 11 12 13 14 15 16
Price each, $\frac{3}{4}$ x3... \$3.00 \$3.60 \$3.75 \$4.00 \$4.35 \$4.65
Other sizes average about 10 cts. per pound.

Pile Band Puller

No. 7. Forged steel. Adjustable for different sizes of bands. Price.....\$10.00

No. 8 Pile Puller

For Wood Sheeting Planks
Made for 3x10-inch plank, but can be used for other widths and also for 2-inch planks. Steel forging with $\frac{1}{2}$ -inch chain and ring.
Price each.....\$10.50

Pile Straighteners

Listed under Steamboat Ratchets or Pushing and Pulling jacks elsewhere in this catalog—see index.

Track Wheels

For Bridge Travelers, Excavators and Derricks—Made Single or Double Flanged
Cast Iron with Deeply Chilled Face, or of Cast Steel—
Any Style of Boxes Desired

Fig. 1121 Double Flanged

These track, or car, wheels are very heavy and substantial, with wide treads, and can be furnished with either single or double flanges as desired; the single flange wheel is preferred on account of taking a very deep chill, consequently lasting much longer as the rails are often covered with sand or other gritty material.

Can be furnished loose on shaft, but regular style is supplied with axles, 2 5/8" diameter pressed in, turning in bronze bushed boxes or boxes with oil cellars similar to railroad car axle boxes. State style of bearings desired and number wanted. We have patterns for 12 and 18-inch diameter.

Boom Fitting

Fig. 1122

With Shank to Fit a Drop Hammer

Fig. 1122

This is very convenient when it is desired to use the pile driver for light derrick work. The fitting is placed into the square hole of the drop hammer. It is made for a 10-inch boom and is of three tons nominal capacity.

List price \$30.00

Hanging Leaders

Fig. 1123

For suspension at end of boom of derrick; bottom braced from deck of driver, or guyed. Can, of course, be swung to drive batter, sideways and forward, or backward. Fitted with channel liners, back braces and hammer stop. Arranged at top to fit derrick.

State requirements as to length, size of hammer and width of derrick boom.

A swivelling hanger can be placed at the top of derrick to drive sheet planking.

Prices on application.

Fig. 1123

Hammer Stop

Fig. 1124

All forged—no castings used.

Dropped to form a stop, or rest, and pulled back to allow hammer to operate.

Made in the following sizes:

For 1000 to 1200-pound drop hammers..... \$23.00

For 1500 to 1800-pound drop hammers..... 25.00

For 2000 to 2500-pound drop hammers..... 30.00

For 3000-pound and upward drop hammers..... 40.00

Fig. 1124

Roller Spools and Axles

No. 1. Square Shaft

Spool is machine finished, to run on 10-inch wooden or 10-inch iron pipe rollers. We can furnish also the 10-inch oak rollers, 26 feet and under, banded on ends and drilled for crowbar. Four roller spools and two oak rollers make one set.

No. 1. Square shaft. Price per set of four... **\$124.00**

No. 2. Round shaft, very heavy. Set of four. **280.00**

Two oak rollers, 10-inch by 26 feet, banded and drilled... **\$130.00**

Two oak rollers, 10-inch by 24 feet, banded and drilled... **124.00**

10-inch diameter pipe rollers quoted upon request. State length wanted.

Rigid Roller Bearings

These are plain castings to take the place of the spool rollers shown to the left. Instead of rolling they slide on the long rollers. With pipe rollers they are also satisfactory. Our pattern is for 10-inch pipe, about 10 $\frac{3}{4}$ -inch diameter, and also for 10-inch diameter oak rollers. Specify when ordering which is to be used.

Rigid Roller Bearings

Price per set of four... **\$46.00**

Price each... **11.50**

Rollers

Pile Saw Arbor

For Cutting Off Piles Under Water

As ordinarily used they are made to cut off piles 16 to 24 feet under water. We usually allow for 8 $\frac{1}{2}$ feet in length above water, to which we add the depth of cut required to get length of arbor.

The shaft is 3 $\frac{1}{8}$ inches in diameter, and counterbalanced. A 42-inch saw is usually sufficient, but for very large piles this size would have to be increased.

The arbor works on a spline its entire length, and is readily adjustable to any depth within its range. Side rollers and frames are furnished, to be fastened to the inner side of leaders, for the belt to run on.

The speeds and approximate horse powers required for different diameters of saws are as follows:

36-inch saw, 700 R. P. M., 8 H. P.

42-inch saw, 600 R. P. M., 10 H. P.

48-inch saw, 525 R. P. M., 12 H. P.

Our price includes the saw, arbor, pulley bearings, sheaves, swivel hook, counterbalanced sheave, side frames and rollers, with necessary bolts to fasten all to woodwork, together with a drawing for the woodwork and fastening in place.

Our regular pile driver engines can be fitted with an attachment for driving the saw. When this feature is desired we cast the frame with an extension on the front end to carry an extra shaft, driven by a pinion from the front drum shaft; this shaft carries a pulley in the center of the engine and from which the pile saw arbor may be driven direct.

Price of pile saw arbor, regular 28 $\frac{1}{2}$ feet... **\$380.00**

For increase or decrease in length, prices quoted upon application.

The Blake Rock Breaker

The Blake Rock Breaker has been a standard machine for so many years for preparing rock for finer crushing by stamps, rolls or Huntington mills, and is so well known that little description is necessary. Its wearing parts are few and the cost for repairs is very low. The crushing surfaces of the stationary and swing jaws are removable plates of white iron or cast steel. These plates are reversible, so as to give the maximum amount of wear.

In addition to the wedge adjustment for taking up the wear, toggle plates of different lengths are furnished which can be inserted on either side of the pitman to give the desired opening between the jaws and thus regulate the size product. We provide, with these Rock Breakers, tight and loose pulleys and a pillow block for an outboard bearing.

The capacity of a Rock Breaker depends on the distance between the jaws and the number of revolutions. The capacities, as specified in the table, are the average capacities when the machines are run at the speed stated, with the jaws 1 1/2 inches apart, and properly fed. The amount of product is also affected by the kind of rock; hard, brittle rock will go through faster than sandstone, or tough rock.

When estimating on the size of engine to drive one of these machines, it is wise to figure on using more power than that given in the table.

Gyratory Rock and Ore Crushers

In estimating power required for crushers, ample provision has been made for driving elevator and screen.

An accurate estimate cannot be made that will cover all classes of materials. Very hard rock will diminish the capacity. It takes more power per ton to break the rock to 1 inch than to 2 1/2 inches and larger. For fine crushing, add liberally to the power. The general rule for crushing the hardest stone to sizes mentioned is 1 H. P. per ton of stone broken per hour.

Always state the kind of stone or ore to be crushed, the grade of fineness required and the capacity wanted per hour in tons or yards.

The Grizzly

PLATE 5

The Grizzly is made of special bar iron, of taper section, placed on edge and fastened together by rods and mesh thimbles of cast iron.

It is built into the woodwork above the ore bin, at an angle of about 40 degrees, its sides being formed of plank. It varies in width from 3 to 6 feet and in length from 8 to 12 feet. We make them of any size desired.

No.	Size of Grizzly, Feet	Size of Bar, Inches	Mesh, Inches	Weight, Pounds	Price

Stone Elevators, Cars and Friction Hoists, listed elsewhere in Catalogue

Fig. B1

Challenge Ore Feeder

Fig. B1 shows our Challenge ore feeder arranged to be tappet driven.

The frame is of steel throughout, making it very rigid and durable.

The legs are made extra long so that the track may be on a floor at the level of bottom of mortar.

Track is provided so that feeder may be moved back and away from the mortar to make the necessary clean-ups or repairs.

Full information furnished and prices quoted on application.

Channon Bin Gates Bottom Discharge

Fig. B2 shows the type of bin bottom gate most commonly used. It is very simple, strong and serviceable, and is operated by hand lever as shown.

We are prepared to furnish other gates of standard and special design to suit conditions without outlets proportioned to size of pumps and capacity required.

Prices on application.

Fig. B2

Channon Side Discharge Bin Gates

Fig. B3 is the standard form of gate for discharging ore from side of bin. It is operated by a hand wheel in connection with a rack and pinion as shown.

By substituting a chain sheave for the hand wheel, gate may be operated by hand chain from the ground or other convenient point.

Made in a variety of sizes.

We can also furnish clam-shell under-cut and other gates of standard form for discharging ores, stones, coal, etc.

Full information and prices on request.

Fig. B3

Ten Stamp Batteries

The plate at left show our ten stamp battery placed on a heavy cast anvil block supported by concrete. We can also furnish mortar for bolting to a wooden mortar block usually 2-inch by 12-inch planks fastened together by 30-penny spikes.

Some users place the mortars on solid concrete mortar blocks and have reported increased capacity due to superiority of concrete over wood.

These batteries are built in either five or ten stamps on cam shaft with wood pulley on either side.

The battery may be started or stopped without interfering with the operation of any other part of the mill by means of a belt tightener as shown.

We are prepared to furnish complete iron work with stamps of any specified weight or drop, including a full set of hardwood guide blocks and wooden cam shaft pulley. Also bolts, rods, nuts, washers and piping for the battery. Also the necessary machinery for combination mills, including amalgamation pans, cleanup pans, retort and bullion furnaces, gold retorts, ingot molds, etc. Also cyanide mill equipments, including tanks, cyanide filters, zinc boxes, etc. Also re-grinding machinery, such as Huntington Mills, Chilean Mills, Ball Mills and Tube Mills.

A complete set of working drawings for the erection of the mill is included in our price, and furnished with order so that millwright will have no difficulty installing the plant.

We are also in position to furnish three-stamp prospecting mills.

Let us figure on your work.

Gold Stamp Mill

With Amalgamating Plates and Concentrating Tables

Cross Section in Elevation Through Center of Battery

The ore, as it comes from the mine, is reduced in the crusher house to the size required for the Stamp Mill. It is then carried by a belt conveyor, with an automatic tripper, to the bins behind the stamps. From these bins it is automatically fed into the stamp mortars which discharge onto the copper tables. The material from the tables is then treated on the concentrators.

The K-B Pulverizer

For reducing materials containing lumps 3-inch diameter and under to a fine product.

It will handle limestone for cement making and agricultural purposes, coal for coking, fluor spar, phosphate rock, gypsum, oyster shells, ores, etc.

The material is fed into the machine through the hopper as shown in cut below and is hurled by the hammers, revolving at the rate of 1000 r. p. m. against the breaking block. When sufficiently reduced the pulverized material is discharged through the screens in bottom of the machine.

The K-B pulverizer is built entirely of steel and is lined throughout with heat-treated chrome steel plates, or manganese hardened steel castings, depending upon conditions of the work.

The hammers are made of manganese and by an ingenious method of mounting they can be readily adjusted to wear, thus **prolonging the life of the hammers, maintaining a uniform product and the high efficiency of the machine.**

The screens vary in design, depending upon the material to be crushed. They can be inserted or removed by sliding them through the lower casing. If the material should clog in the pulverizer because of its too rapid feeding, one man can easily and quickly remove the end plates from the lower casing and draw out the screen. Very little time is lost or effort required in the operation.

The No. 1 machine stands about 30 inches high and covers a floor space of 2x5 feet (from pulley to fly wheel). The No. 2 machine stands about 40 inches high and covers a floor space of 3x6½ feet. A No. 1 K-B pulverizer will reduce three to four tons of limestone per hour to 20 mesh, and four to five tons per hour to 10 mesh. A No. 2 K-B pulverizer will reduce eight to ten tons per hour to 20 mesh, and ten to twelve tons per hour to 10 mesh. The No. 1 machine requires about 15 H. P. and the No. 2 requires about 30 H. P. to operate.

No. 1 K-B pulverizer. Price.....\$ 783.50
No. 2 pulverizer. Price.....1,467.00

Crushing Rolls

Frame is of the box type, cast in one piece and heavily ribbed on the inside, having the fixed roll shaft bearing cast on. The inside is hopper shaped, with the discharge opening sufficiently large to allow the stream of crushed ore to pass through without coming in contact with the frame, thus avoiding wear. The removable bearings swivel in the pedestals, which glide on guides in the frame.

The bottom half of roll housing extends to the center of roll shaft and is cast integral with the roll frame. The upper half consists of two cast iron side plates and a feed hopper or distributor.

It is fitted with cover and inspection door in center of top. The joints of housing are all machined and shaft openings are covered with dust plates held in place by springs. It is dust proof.

The feed hopper has two hard iron, or manganese steel baffle plates, which spread the ore the entire width of rolls. The check plates are of hard iron and rest on the ledges cast inside the frame. The plates are bolted to the housing and can be removed through top opening without dismantling any part of the machine.

The roll shafts are of forged steel and extra heavy. The shells are of extra hard and tough rolled, or manganese, steel finished. The cast roll centers are in two parts, turned on outside to fit the double taper of shells, and drawn together by binding bolts.

Prices on Application

Size, Ins.	Max. Feed When Crushing 4 to 1		Size of Pulley, Inches	Wt., Lbs.
	Smooth Shell Ins.	Cor'g'd Shell Ins.		
21x14	1	2	60x 8½ and 30x 6	11200

54x24	2½	4½	108x17 and 54x13	105500

Revolving Sizing Screens

With Steel Housing

These revolving screens, or trommels, are designed to screen ores with little fall, and to avoid the vibrations incident to shaking screens. When the ore is once in motion very little slope in the direction of the screens length will cause it to move forward.

A "V" shaped steel housing is used to catch the undersize and convey it to the succeeding screen. Two or more screens are used, depending upon the number of sizes required. The different sizes of materials are conveyed through launders to the jigs.

Dimensions and Weights

Diameter of screen, inches	24	30	30	36	36	42	42	48	48
Length of screen, feet	6	6	9	6	9	6	9	6	9

Weight with housing, pounds	1100	1200	1600	1600	2200	2000	2600	2300	3000

Wood Frame Ore Jig

The Hartz type of jig here illustrated is the one most commonly used. It is employed successfully for treating coarse and fine ores and for recovering higher and lower specific gravity minerals. Two or three mineral separations can be made.

The jigs can be furnished with one or more jiggling compartments, each with its own sieve and plunger. Two, three and four compartments are the most common.

They are also made in the single and double types. The double jig is two singles placed back to back. Their tanks are supported and bound by timber frames, of which there are usually one to four compartments. We can also furnish them with iron frames.

The screen in the Hartz jig is stationary and the water is caused to rise and fall through it by the action of the plunger.

The jigs take the feed from the revolving screens, or trommels, and each jig is adjusted to handle fine, medium or coarse materials.

Hydraulic Classifiers

Each unit consists of two inverted cones, one inside the other. The inner cone is suspended from a cross bar and is adjustable in its relation to the outer cone.

The slimes run into the inner cone and pass out at the bottom into the annular space between the two cones. Here they encounter an upward current of water coming from the pipe at the side of the chamber at the lower end of the outer cone.

The fine slimes are carried up by the ascending current of water and overflow into the trough surrounding the outer cone. The heavier particles fall into the chamber and are drawn off through the valve in the bottom.

The regulation of quantity and size of material drawn off is effected by the adjustment of the inner cone and the quantity of water admitted to the chamber.

These sizes are generally used in series, increasing in size from No. 1 up. For example No. 1 size for two concentrating tables, No. 1 and 2 sizes for three concentrators, etc., depending, of course, upon the ores.

Weights and Dimensions

Diameter, Inches	Mesh	Weight, Pounds	Total Height, Inches
12	8 to 20	160	34
20	20 to 30	320	43
30	30 to 40	500	56
40	Finer than 40	850	71
60	Finer than 40	1100	86
72	Finer than 40	1500	105

The Overstrom Ore Concentrator

For Treatment of Fine and Coarse Sand Feeds

The Overstrom table is adapted to the treatment of fine and coarse sand feeds ranging from 16 to 100 mesh. In operating position the deck is diagonal to the line of movement. This diagonal feature results in making the entire deck surface available for the settlement of mineral and as a result the Overstrom table handles a larger tonnage than the ordinary concentrating table of equal or even larger area. A very clean concentrate is produced owing to the greater transverse distance the cleaned mineral has to travel before discharging in the concentrate launder. The Overstrom table has proven its superiority for concentrating low grade iron ores. It is an ideal table for this class of work or for concentrating low grade ores of any kind, on account of its large capacity, general efficiency, and small maintenance cost. It has no superior for the concentration of ores where a two or more concentrate product is desired.

The table deck is constructed of the best grade of cypress rigidly braced and stayed, all fastenings being either screws, bolts or rods. The concentrating surface is covered with either the first quality linoleum or rubber. The riffles used are well seasoned sugar pine.

Deister Ore Concentrator

The Deister latest improved No. 3 slimer is furnished in either single or double deck type. It is essentially a slime machine designed for feeds of 80 mesh and finer. It embodies in its deck and mechanical construction all those features which continued use and experiment have demonstrated to be essential to its highest metallurgical and operating efficiency.

The feed crosses the table transversely. It flows in a thin film across the area adjacent to the feed box and is there stratified. It then encounters the relatively still water of a pool which serves as a baffle against the transverse progress of concentrates, resulting from the prior stratification. The differential motion imparted to the deck constantly advances the mineral to the concentrate edge, where it is discharged. The greater slope of the deck below the pool facilitates the sloughing to the tail of the gangue and the coarser sands which the feed may contain.

There is a decided advantage in the use of this table for the concentration of ores containing two or more valuable minerals where two or more products, each of a shipping grade, are desirable.

The table deck is shipped completely riffled ready for placing on table supports.

The wash water launder is supported over the table deck by a stand and adjustable extensions, and being independent of the table produces an even flow of water.

Frue Vanners

For Ore Concentration

The vanner is a fine sand and slime concentrator and does its work on the upper surface of an endless belt which is slightly inclined from the horizontal and receives a rapid shake in the plane of the belt, while at the same time it has a continuous slow motion up the incline. The agitation makes the ore bed so loose that minerals of higher specific gravity can settle to the lower layer, while those of lower specific gravity use this upper layer.

The travel of the belt carries the heavy mineral to the upper end and the surface water washes the light mineral down to lower or tail end. The heavy mineral adheres to the belt and is carried over the head end, washed off and deposited in a rectangular tank, under the machine, which is filled with water.

The concentrates may collect in the tank and be hoed out or may run out continuously through small spigots. In either case there is an overflow which goes to settling boxes to save the fines.

The belt generally has a smooth surface, but corrugated belts can also be furnished.

We can furnish these vanners in 4-foot or 6-foot widths. The capacity of a 4-foot Frue vanner on 50 mesh stamp mill pulp is 4 to 6 tons in 24 hours, and 6 to 8 tons if the pulp is a trifle coarser. 6-foot vanners have a capacity of from 8 to 16 tons in 24 hours. $\frac{1}{2}$ horse power is required to drive.

A standard 6-foot Frue vanner complete with plain belt, boxed ready for shipment weighs 3500 pounds. A standard 4-foot vanner weighs 3000 pounds.

"Channon" Portable Steel Elevator or "Stacking Machine"

For Stacking Boxes, Bales, Rolls, Etc.

Not only a labor saving machine, but one that will enable the warehouseman to utilize all of the space up to the ceiling—stacking or piling up the heavy packages in regular tiers, easily and quickly. Can be used advantageously in narrow aisles with but an inch or two of clearance, as the platform is open on three sides, cantilever type, to permit of loading in front and discharging at either side when unloading to top of pile.

This "elevator on wheels" can be moved to any part of the warehouse—the uprights are usually hinged at a point that will permit passing through doors or other obstructions. Wheels are roller bearings and while this machine was not designed for a truck, can be moved with great facility on any ordinary level floor that will carry a platform or warehouse truck.

Can be used in basements or other places with low headroom as it requires no overhead support, it is self-contained, consequently material can be piled closer to the ceiling than with other forms of hoisting devices—there is no waste space such as would be taken up by tackle blocks and slings or the beams of a traveling crane.

Advantages.—Bulky, heavy cases may be handled by one man, the package is lifted to the level of the first tier—then slid over on the rollers—unloading from stock piles is accomplished in the same manner. Piling and shipping may be handled with one-half to one-fourth the number of men. The storage capacity is greatly increased. Stock may be piled or stacked in an orderly manner, thereby facilitating easy removal.

The design is amply strong, with rigid construction between base and uprights which carry the platform and its load.

Has positive floor lock which operates automatically and prevents movement of machine while the load is being lifted.

The machine is safe and simple, all hand machines are equipped with a positive acting ratchet and pawl device, which must be properly set before the crank can be applied to the hoisting mechanism and the pawl cannot be released until the brake has been set and the crank removed. This prevents operator from being struck by the crank, if, through carelessness, he neglects to remove same.

500-pound size is a useful size and strong enough to handle a good proportion of warehouse packages and light enough to be moved around handily.

This size is single geared and has $\frac{1}{2}$ -inch steel hoisting cable. Has friction brake, crank guard and ratchet and pawl.

1000-pound size is the standard machine for most lines of work. It is compound geared, with two crankshafts and two speeds—the second shaft gives twice the speed in lifting one-third of maximum load. This feature is useful in lifting a light load or raising the platform when empty, preparatory to lowering packages from the pile.

The hoisting cable is $\frac{1}{2}$ -inch Reliance Swedes Iron. Has friction brake, ratchet and pawl of releasing type and crank guard.

Information Required

State total height of machine desired; height of lowest opening machine is to pass through; maximum load; kind of material to be handled, and the kind of floor in warehouse.

Standard Sizes and Prices of Hand Power Machines

Any Height Up to Ft. In.	500-Pounds Capacity					1,000-Pounds Capacity				
	Lift Ft. In.	Price	Base Frame, Inches	Platform, Inches	Base Wheels, Inches	Lift Ft. In.	Price	Base Frame, Inches	Platform, Inches	Base Wheels, Inches

16 0	14 5	175.50	40 x 47	26 x 39	5	13 11	193.50	42 x 54	30 x 40	5

Prices on 1,500 and 2,000-pound hand machines also power machines in heights up to 30 feet, capacities up to 4,000 pounds and platform speeds up to 50 feet per minute, quoted upon request.

Platform lift on 500 pounds is 21 inches, on 1,000 pounds 25 inches less than total height of machine.

The above machines have hinged uprights for folding down when passing through doors, etc.; usual clearance height is 6 feet 2 inches on 500 pounds and 6 feet 10 inches on 1,000 pounds—if hinged upright is not desired, deduct \$9.00.

Prices include full case handling equipment, consisting of platform rollers, two pipe rollers and crow bar—if these are not wanted, deduct \$4.50.

1,000-Pound Capacity, Hinged Upright, Compound Geared

Union One-Man Inspection Elevator

A Simple, Safe and Convenient Machine for Grain Elevators, Flour and Cement Mills, Ore Crushing Plants, Factories, Etc.

For the safe and efficient operation of any grain elevator or mill, the cupola should be inspected at least three times a week and sometimes oftener.

Usually this is a tedious and tiresome trip and is avoided as much as possible by the average employe and most owners.

By means of the One-Man Elevator, all of the unpleasant features of this inspection trip are eliminated and it is possible to quickly and easily travel up or down from one floor to another without mechanical power of any kind.

The elevator is provided with a counterweight of sufficient size to not only take care of the weight of the platform complete, but also to counterbalance the weight of any average size man. In addition, there are sufficient equalizing weights on the platform so that it is possible to get almost a perfect balance.

All that is then necessary is to press down on the foot treadle and a slight pull on the hand rope will move the platform either up or down at almost any desired speed, according to the pull applied.

To stop the lift, simply removing the foot from the pedal will stop the elevator at any desired point.

The elevator can be operated only when the man is on the platform, eliminating danger of accident due to someone else moving elevator from some other floor.

A safety clutch of special design is also provided, so arranged that if lifting rope should break, dogs or grips will clamp the guide and prevent platform from falling.

Suitable hand railings together with a simple type of gate that cannot be left open should be provided at each floor to prevent accidents.

The installation of one of these elevators allows quick and easy access to any part of plant regardless of the height, thus reducing danger of fire from lack of attention. Coupled with this, the installation of one or more fire extinguishers on the frame ready for instant use at any point, should mean a material reduction in insurance rate.

The Standard Elevator is fitted with wooden platform, hard wood guides, and manila rope. The lifting rope is frequently made of flexible wire cable. The guide and tail ropes can also be furnished of wire cable at a small extra charge.

The All-Steel Elevator is constructed entirely of steel bars, angles and plates, except the hard wood guide rails which are always required for smooth operation and the safe action of the locking device.

Floor Plan

Floor Space

The floor space required for the standard equipment is comparatively small, being only 28x41 inches over all (see floor plan at left) and the installation of one of these outfits in either new or old building is a very simple matter.

Standard Elevator

Standard Elevator with oak frame, 26 by 29-inch platform, complete, one head frame with sheave and bearings, one counterbalance weight, three equalizing weights, one each lift, guide and tail ropes and one set of hard wood guides for 35-foot travel.

Price.....\$90.00

For additional travel up to 100 feet, add 90 cents per foot.

All-Steel Elevator

All-Steel Elevator with steel frame, 26 by 29-inch platform, complete, one steel Head frame with sheave and bearings, one counter balance weight, three equalizing weights, one each flexible wire lift, guide and tail ropes and one set of hard wood guides for 35-foot trail.

Price.....\$180.00

Channon Elevators

Manufactured in our own shops in Chicago since 1894—in all styles of hand, belt, steam, electric, air and hydraulic power—also dumb waiters, basement hoists, contractors' material elevators, also automatic safety gates, doors, etc. Ask for special catalog.

No. 10—Little Dandy Dumb Waiter

Capacity 25 to 100 Lbs.—Hand Power

This is the simplest kind of a dummy elevator, one especially adapted for hotels, stores, restaurants, offices, etc., to carry light loads quickly from floor to floor.

Elevator is easy to operate and can be readily set up.

The sheaves, all of proper diameter, are lathe bored and fitted with our self-lubricating bronze bushings, which reduce friction and require no oil. Sheaves are fitted to turned steel shafts and upright stands are furnished.

Car is of whitewood, neatly finished in oil, usually made 24 inches wide, 20 inches deep, 28 inches high, with or without movable shelves. We can supply any other size cars to order.

The operating rope is of $\frac{5}{8}$ -inch diameter, best cotton.

All dumb waiters furnished with automatic, for each floor, holding car until released.

With complete outfit is furnished; car, upper and lower sheaves with shafts and stands, counterweight, necessary rope, rope connections and guide strips.

Travel	Size of Standard Car, Inches	Approximate Shipping Weight, Pounds	Net Price Complete Without Enclosure
1 Story	24 inches wide	150	\$ 90.00
2 Story	20 inches deep	175	100.00
3 Story	28 inches high	200	120.00
4 Story		225	135.00

No. 11—Geared Dumb Waiter

Capacity 50 to 300 Lbs.—Hand Power

Our "Geared" Dumb Waiter is built on the principle of our regular hand power elevators; it is a well made machine for capacities up to 300 pounds.

The machine is fitted on a hard pine frame, which is easily set in place; the parts consist of a pair of cut gears, a hoisting sheave of V-groove for cable, a hand or pulling rope wheel with brake rim attached, all keyed to steel shafts turning on babbitted journal bearings.

The Brake is our latest design, always positive and secure, and can be operated from any floor, being applied and released by Manila brake lines.

The car is made of ash, well mortised, is fitted with shoes to travel on hardwood guide strips. The standard size is 24 inches wide, 20 inches deep, 28 inches high, but other sizes can be supplied to order. Furnished with or without movable shelves.

Car is lifted by one $\frac{1}{2}$ -inch diameter hoisting cable connecting to weight; hand or pulling rope is $\frac{3}{4}$ -inch diameter best Manila.

Travel	Size of Standard Car, Inches	Approximate Shipping Weight, Pounds	Net Price Complete with Car
1 Story	24 inches wide	300	\$135.00
2 Story	20 inches deep	325	153.00
3 Story	28 inches high	350	180.00
4 Story		375	200.00

Geared Type

Channon Hand Power Elevators

The difference between the No. 3 and No. 1 is in the platform, the former being suspended by a cable at each corner, affording plenty of head-room for vehicles.

The equipment furnished includes:

One cast iron hand wheel with brake pulley attached; one cast iron gear and pinion, all accurately lathe bored and securely keyed to shafts; shafts are cold rolled steel, operating on anti-friction roller bearings.

The drums, usually two in number, are made up of cast iron, grooved for perfect travel of cables.

The brake is positive in action and can be noiselessly operated from the platform, or any floor.

The No. 1 elevator is equipped with the "Union" Safety System, which throws the dogs in contact with guide strips in case of breakage of cables, thus preventing the fall of the car.

Cars have hard pine bottoms bolted to angle iron at the sides and covered with maple flooring.

No. 1 Center Lift

For Use in Warehouses, Stores, Factories, etc.

Furnished with three cables (two for hoisting and one for counter-balance) Reliance Brand Swedes Iron, annealed. The hand or pulling rope is pure manila of large diameter.

No. 1—Prices for Travel Up to 20 Feet

4000	8 x 16	5000	456.00
4000	8 x 18	5500	496.00

Prices for travel over 20 feet quoted upon application.

Above prices include counter-weight of 100 pounds in excess of weight of car and are for complete outfits, excepting timbers. Blue prints showing full details of erection furnished with each elevator.

Directions for Measurement. Send sketch showing height of each story from floor to floor travel of elevator and in top story, the height from floor to ceiling, where overhead machinery is located. The floor opening must be 12 inches wider, postway, than you want the car in the clear and 2 inches larger front to back. The minimum head room required for overhead machinery is 11 feet.

ELECTRIC FREIGHT ELEVATORS

Fig. C1

Our most popular direct connected, electrically operated elevator. Especially adapted for handling automobiles in garages and for general freight elevator service in warehouses, manufacturing plants, etc. Capacity, 1000 to 5000 pounds.

It can be installed directly over the platform. It requires little head room and the cables wind directly onto the drum.

When requesting prices state capacity, size of platform required and electric current available.

Fig. C1

Direct Connected—Floor Type

Fig. C2

Our standard heavy floor type elevator. It is usually set in the basement, the cables being carried to the top of the elevator shaft by guide sheaves. Capacity, 6000 to 12,000 pounds.

Requests for prices should contain full information as to current available, capacity, etc.

Fig. C2

Belt Driven Type

Fig. C3

This is our standard and most popular type of elevator for operating with detached reversing motor. We also furnish this elevator with tight and loose pulleys for belt drive from line shaft or other power.

An inexpensive and highly satisfactory machine. Easy to install and simple to operate.

Inquiries should specify capacity and character of drive. If motor is required, character of current available should be stated.

Fig. C3

Platforms

Used with Freight and Automobile Elevators

Fig. C4

Fig. C4

Our special heavy duty elevator cage for use with double cable lift.

Designed especially for handling heavy automobiles and motor trucks.

When requesting price state size and capacity required.

Fig. C5

Showing our standard freight platform with sides and cover.

Built in any size required.

Fig. C6

Fig. C5

Fig. C6

Illustrating our standard freight platform with posts at corners. This construction permits opening one side and end or all four sides if desired.

We shall be pleased to submit estimate covering any size and type of elevator required.

For power units see preceding page.

The Channon Flush Sidewalk Doors

Single Door
Cast Iron Frame

No Hinges to Break

These doors are absolutely flush and operate on powerful steel levers which are concealed when closed.

When door is raised the lever throws it outward and dirt falls outside, not inward.

It overcomes the great trouble common to hinged doors, due to dirt accumulating between door and frame. The leverage resulting is a severe strain on the hinges and soon causes them to break.

The standard construction is all steel, door and frame. You may drop these doors but you cannot break them.

Can be furnished any size or make with cast iron frame or prismatic lights.

Standard Construction

The Covers are checkered steel plate.

The Levers are crucible steel with bronze pins.

Panel Frame, steel angles or tees.

Door Frame, heavy steel angle.

All complete with lifting ring, hold open rods and backing device, and painted with best quality graphite.

Size of door, 5x6 feet.	Price.....	96.00

Single Doors Quoted on Application.

Double Door Steel
Angle Frame

The Channon Basement Hoist

For Removing Ashes, Barrels, Boxes, Etc.

A simple device consisting of two steel channels connected by a couple of cast iron spreaders which also serve as guides for raising and lowering the telescopic mast.

The frame is secured to the floor and wall by anchor bolts.

It is very easy to operate and takes up very little room in the basement. When not in use the entire machine is below the basement ceiling.

To operate the hoist the mast is raised by the lower crank shown in the illustrations and held in the elevated position by a steel pin.

The hoisting mechanism is operated from the sidewalk level. The hoisting head revolves so that the material may be swung to the sidewalk without lifting.

The capacity of the mechanism is sufficient for any load which it would be advisable to handle with a machine of this type.

When ordering state the height of the basement ceiling.

Price.....\$170.00

Portable House Movers Capstans

Fig. G. 2271

With this style of capstan the wire cable is wound up on the drum until the object to be moved is close up to the capstan; the stakes are then pulled, the capstan raised in the truck, the horses hitched to the front and the entire outfit transported to about 700 or 800 feet further and again staked down—altogether very much quicker than the old style method. The front wheels and tongue are used as a stake puller.

The two upright ratchet bars, passing through the rear axle, support the rear end of capstan bed. The hand lever, when pulled out, release the ratchet bars and the capstan is deposited on the ground, ready to stake. Bed is raised again by crowbar. The front part of the bed is supported by chains passing through angle plate on the front axle.

The drum is 12 inches in diameter and will hold about 800 feet of $\frac{5}{8}$ inch diameter wire cable. The drum is all steel construction, which is strong and light. The only wearing part is the pin at the bottom of the spool. This pin is replaceable when worn.

Price with 32x3-inch steel truck wheels, including capstan sweep.....\$150.00

Fig. G. 2273

Standard Steel House Movers Rope Capstan

This Capstan is not the usual home made affair as made by a country blacksmith—it is strictly up-to-date in every respect.

The frame is made up of steel angles and well braced. Shoes and chain are placed at each end so you can pull from either direction with horse in resetting. All bottom bolts are countersunk. The housing is fitted with a hasp so you can release spool to place cable on the drum. Spool has heavy cast head for the sweep. Pole of spool is a $2\frac{1}{2}$ -inch square steel bar; drum is cast iron 10 inches diameter. The lower bearing is 3 inches in diameter and 2 inches long.

Price each.....\$65.00

Fig. C2270

An outfit generally consists of four trucks which are capable of moving a large size building. Each rear truck has a short tongue five feet long which is lashed or fastened to the beam. The front trucks have a 12-foot tongue. Capacity is 20 to 40 tons per truck. These prices are for one two-wheel truck only; each truck consisting of two wheels, one round solid steel axle with bolster attached, complete with heavy tongue, braces, and king bolt.

All Steel House-Moving Trucks

Illustration shows a single truck with the beam or timber in place. We do not furnish the beam but only include it to show its position. Each truck consists of two wheels, one round steel axle with solid iron bolster attached. The bolster extends above the wheels so as to permit the wheels to turn under the beam and is 18 to 22 inches wide at top, according to the width of tire used. The wheels track 30 inches from center to center of tire, making axle from 42 inches to 45 inches long over all. Tongue is oak, heavily ironed, complete with braces and heavy king bolt.

Height of Wheels, Inches	Size of Axle, Inches	With 10x $\frac{3}{4}$ -inch Tire		With 10x $\frac{1}{2}$ -inch or 12x $\frac{1}{2}$ -inch Tire		With 12x $\frac{3}{4}$ -inch Tire		With 14x $\frac{1}{2}$ -inch Tire		With 16x $\frac{1}{2}$ -inch Tire

An outfit usually consists of four of the above trucks, with two 5-foot and two 12-foot tongues. For general moving, we recommend four trucks with wheels 24 inches high, 12x $\frac{3}{4}$ -inch tire, 3 $\frac{1}{2}$ -inch steel axles.

Four Wheel House-Movers' Truck

Fig. C2272

This four wheel truck is strong and substantial. The capacity of one of these trucks is about 40 tons and the weight of one truck about 1200 pounds.

Fitted with staggered spokes wheels which are as near perfect for strength and durability as can be made. Note the well braced rear axle. All wooden parts are well protected from the weather by the best of paint. These trucks have 3-inch carbon steel axles.

Price of one truck as shown with 24-inch diameter spoke wheels with 12x $\frac{1}{2}$ -inch steel tires with either iron or wood bolster as desired. Each.....

Price of one long tongue and truss header, each.....

An outfit usually consists of three trucks as per illustration and one long tongue and truss header for front truck.

We can also furnish 8-wheel trucks and trucks with web wheels and steel bolster,

\$125.00
40.00

The Swenson Stump Pulling and Grubbing Machines

Especially Adapted to Contractors' Use in Clearing Right-of-Way

Can Also be Used for House Moving

These machines have more up-to-date improvements than any other that we know of—equipped with large diameter grooved drum; rope won't slip, crowd or chafe; malleable frame; can be thrown in and out of gear at the machine as well as at the end of the sweep and without lifting the sweep—has hand-wheel for quickly taking up slack cable, back ratchet at bottom of drum as well as at top—heavy anchor frame holds machine rigidly whether rope is high or low on drum—has rope guides, hinged and adjustable, held by springs, prevents cable from over-lapping, crossing or shearing. Machines are all furnished complete with sweep and bed-timbers, has truss-rod full length of the sweep.

Faultless Stump Puller

There's Money Under Every Stump

The Faultless Stump Puller is powerful, durable and safe. It is used by many of the largest contractors in the country as the best equipment for clearing land. How much time are you losing by plowing or harvesting around stumps on your land? How often does your harrow or drill catch in the roots and cause breakage and loss of time? How much valuable space are you losing by allowing these stumps to occupy room in your fields? Can you afford to leave them there, when you could clear from one to five acres of land a day with the Faultless Stump Puller? This machine is so constructed that the pulling coil is always the bottom coil. This great advantage gives uniform power from the beginning to the end of the pull. It relieves the machine of the strain produced by a hard pull when the tension is not direct, as well as preventing the cable from grinding itself to pieces. It prevents the machine from tipping over and injuring the operator. The main shaft is composed of cold rolled steel shafting; the main brace, side braces and tail brace of bar steel; the bottom box of malleable iron; sweep, bed plank and tail piece of selected, straight grained hardwood. It is a "built to last a lifetime" machine.

Specifications

No. 2. Develops 85 H. P. and is Recommended for Stumps Running 14 to 16 Inches in Diameter at Base

No. 2. Two-horse power Faultless Capstan, complete, including the 100 feet $\frac{3}{4}$ -inch Faultless Steel Main Cable, the 10-foot anchor cable of the same material, the sweep, lead pole, truss rod, brace, steel hook, clamps, etc.; all ready for use.....	\$104.75

The Clark Automatic Power Shovel

The quickest and most economical appliance for unloading small coal, grain, etc., from box cars.

Illustration shows a Single Clark Automatic Power Shovel. They are generally used in pairs, both being placed on the same shaft, side by side. They are perfectly automatic in action and may be adjusted to throw in or out of gear at any desired point. A double shovel operated by two men will unload a car in about five minutes and a single machine with one man in about fifteen minutes.

Price List

Single Shovel.....	\$100.00	Double Shovel.....	\$200.00
--------------------	----------	--------------------	----------

The above price list includes the following fixtures with each single shovel: One scoop, 35 feet of rope, scoop chain, two horizontal sheaves, one swivel sheave and shaft with sufficient projection to receive driving pulley. An extra charge is made for the driving pulley, the amount depending upon the size required.

The Triumph Automatic Water Lift

Designed to pump filtered or rain water from a cistern direct into the house pipes and plumbing fixtures or into an attic storage tank.

Operated by hydraulic pressure, that is by the pressure or force of the city water.

Made of bronze, is simple and noiseless in operation. It needs no oil, the wearing parts being leather against metal. Its working parts are few and easy of access. It can be used for direct pumping, or for pumping to a tank.

Steam Syphon Pumps

The simplest apparatus made for raising fluids by steam. Has no piston, no valves, no moving parts. Operated entirely by direct action of steam. To set, it is necessary only to attach steam suction and discharge pipes; to start it, means only the opening of the steam valve.

Height.—The syphon will raise water about one foot for each pound pressure of steam at the pump. If the fluid is heavier than water, this estimate must be reduced.

Capacity.—As given, is based upon 60 pounds steam pressure at the pump and 15 feet lift. With a greater lift or less steam, these capacities will be reduced.

Temperature.—The syphon can be used for pumping warm liquors, but not too hot. About 140 degrees Fahrenheit is the limit. It will not pump boiling water, nor will it force water into a boiler like an injector.

No.	Capacity, Gallons per Minute	Diameter Discharge	Diameter Steam Pipe	Price of High Pressure Pump Only, for Steam Pressure of 30 Pounds or Over
3	30	3/4	1 1/2	\$16.00

"Cameron" Regular Pattern Steam Pumps

Mine and General Service Type—Single—Direct—Acting

The Cameron pump is of simple, yet superior design of best material and exact and thorough construction, few working parts, no outside valve-gear. There is nothing to get out of order and it can be run continuously at highest possible speed without damage to its parts. Suction pipe may be lifted out of the water and then allowed to race without danger of piston striking the heads or otherwise injuring the pump.

Pump can be completely taken apart without disconnecting any of the piping.

The first seven sizes may be furnished with hand lever attachment when so desired and ordered.

Prices include necessary tools, wrenches and sight-feed lubricator.

"Cameron" Mine Sinking Pumps

Standard Vertical Plunger Type

This is the most successful sinking pump that has ever been placed on the market. Any steam pump that is to be used in sinking a mine shaft must be strong, certain in operation, capable of handling gritty water, require little attention, and above all, be able to stand the roughest kind of usage without sustaining injury.

The Cameron sinking pump has no outside valve gear, arms or levers to be bent or broken off. It cannot suffer from violent collision with the walls of the mine shaft, and is not likely to receive injury from the explosion of blasts.

Being fitted with our exhaust cut-off, it will run along as fast as steam will drive it with an irregular or intermittent supply of water, or when the water fails entirely, not only without danger of the piston striking the heads, but without injury to the valves.

"Cameron" Steam Pumps Regular Boiler Feed Pattern

Give quantity of feed water required; a pump which will supply this quantity at about one-half its rated capacity at ordinary speed will be right for cold water, and say one-third speed for hot water.

In feeding hot water the pump should be placed below the source of supply. The first six sizes furnished with hand-lever attachment when so desired.

Size Number	Prices				Diameter of Steam Cylinder, Inches	Diameter of Water Cylinder, Inches	Stroke of Piston, Inches	Boiler and P. there will supply at mod. speed based on 30 lbs. of water per H. P. per hour	Steam Pipe	Exhaust Pipe	Suction Pipe	Discharge Pipe

The Cameron Steam Pump—Removable Bushing Pattern

Where mine water is very gritty and the use of a plunger pump is prohibited on account of limited space or other circumstances, to secure the greatest durability possible with a piston pump, we supply a removable bushing of iron or composition. This bushing can be turned in the pump so that the wear, which is usually greatest on the bottom, can be gradually distributed over every portion of its surface. Furthermore, if, from the deepening of the mine, it becomes necessary for the pump to be placed lower, the removable bushing can be replaced by one of smaller diameter, thus changing the proportions of the pump, and enabling it, within certain limits, to work against a greater head.

The Cameron Outside Packed Plunger Pump—Regular Pattern

This pump is especially adapted for station duty in mines, and is far more durable than a piston pump for handling gritty water.

There are no wearing parts in the water and except the packing in the stuffing boxes, which can be instantly tightened up from the outside. Since the plunger works in loose sleeves, the pump barrel cannot be cut or worn by grit or sand, and the stuffing boxes are placed in the center, so that there is no tendency for the plunger to sag. It is more compact than any other make of plunger pump, and has no outside rods or crossheads. It is also adapted for feeding boilers under heavy pressure.

Duplex Piston Steam Pumps

For Boiler Feeding and General Service
Packed Water Pistons

Nos. 2, 3, and 4 pumps

Nos. 6 and 8

Sectional View of Water End

Valve Seats and Springs

Valve seats, springs and bolts of composition metal. Seats are screwed into the decks on a taper. Springs are cylindrical and the valve bolts have shoulders for guiding the springs. All rubber valves have plate washers.

Style No. 8 and Larger Showing Bed Plate and Air Chamber

Regular Fitted Pumps have Brass water cylinder linings, iron fibrous packed pistons, iron stuffing boxes and steel piston rods. **Brass Fitted Pumps** have brass linings, also bronze rods.

Lever Pumps Nos. 1½ and larger have forked levers, giving double the wearing surface in the cross-heads, and are so arranged that the piston rods cannot turn—a decided improvement over the single arm type.

No. 6 and larger pumps have roller bearings in the cross-heads and divided or two-piece rods, permitting removal of rod on either end without disturbing other end. Rubber or brass valves furnished as desired.

Prices on intermediate sizes and high pressure valves on request.

Low Service, Plunger, Compounded and Large Size Steam Pumps upon Request.

Automatic Feed Pump and Receiver

For draining steam coils, radiators, heaters, drying cylinders, steam jackets, etc., and feeding condensation into the boiler.

The pump is automatic in its action, returning the water into the boiler in a steady and continuous flow as fast as it accumulates. Its action is automatically controlled by a seamless copper float (tested at 300 pounds) within the receiver.

When water is out of the receiver the pump is brought to a stop.

The regulating valve is equipped with a removable metal disc which can be replaced at small expense.

The receiving tank is heavy guaranteed and tested for 200 pounds, has a compartment to catch sediment and chips from return pipes, radiators, etc.

The governing arrangement is attached to receiver head so that when repairs are necessary, removal of head permits easy access to all parts.

Each size has three openings in top for returns. When more are required they can be connected in end of receiving tank.

*1,000 square feet of radiating surface equal about 3,000 linear feet of one-inch pipe.

Outside Center Packed Plunger Pumps

300 Pounds Pressure

These pumps are suitable for all conditions of service and especially recommended for pressures in excess of 150 pounds and for pumping water containing grit, sand, gravel, etc.

The plungers being exposed are easily kept lubricated, and all leakage is prevented by an adjustment of the stuffing box glands, and proper maintenance of the packing.

Sizes 10x6x12 and larger have water cylinder cast in sections securely bolted together, with copper gaskets between joints. If a rupture should occur in any part of the water cylinders renewal of that section only is necessary.

"Nye" New Model Double Cylinder High Pressure Steam Pump

Front View
Showing Hooks for
Suspension

The all-around contractors' pump—elevations up to 125 feet. Has no engine, pistons or plungers. Works suspended or stationary. Pumps muddy or sandy water. No exhaust. Steam is used twice. For cofferdam and caisson work, quarries, mines, well-point systems, paper mills, tanneries, gas and chemical works, refineries, etc.

Features. This pump creates a high vacuum and therefore has greater suction lift and will discharge to a greater height with greater rapidity and with less steam than other pumps of similar type. It has no pistons or plungers, no engine with gears or other parts to cause trouble. It is impossible for sand, grit or mud to affect its operation. Will suck air and water without losing its priming. Discharges a full, continuous, steady stream. Cylinders are air cushioned. Has no exhaust. Steam is used twice. Automatically takes care of variation in boiler pressure. Has mushroom type spray basket jets. Patent priming device. High discharge velocity. No reciprocating parts. Simple and compact, takes up least space. Handles liquids at higher temperatures. Operates at 40 degrees below zero. Shock is eliminated. It will operate equally well suspended or stationary.

Consists of two connected hollow cylinders with discharge chamber at one side, all cast in one piece forming main body of the pump; bottom of these three chambers contains suction and discharge parts. At the top the two cylinders are sealed by steam yoke connection embodying the Nye special spray basket jets. The steam yoke carries two original Nye features, a pair of air valves and a hollow steam valve that floats in its chamber. This valve is extremely simple and sensitive to pressure, vacuum and its own gravity—the operating medium—and is responsible in a high degree for the steam economy of the Nye pump. Its function is admission of steam to the filling cylinder in time to aid the air cushion, overcoming shock from ram action of the rising column of water. Following the cushioning function the steam valve admits steam for the discharge. Filling of the alternate cylinder cuts off the supply of steam, permitting expansion of the residual charge, thereby causing discharge from both cylinders simultaneously. The result of this lap of discharge is a sustained momentum. An almost imperceptible increment is the only evidence of the junction of the discharge cycles.

Priming is not required for short suction, but if it is desired to pump air and water at bottom of suction, keeping the water down so that the men can work to good advantage, a small amount of water can be run through the pump continuously through angle valve at the back of the pump.

No. 2 Outfit with 25 feet of steam and discharge hose.....	145.00

Other types of Steam Syphons listed under Ejectors.

New Style Emerson Steam Pumps

These pumps have capacities between the Junior pumps and the No. 1 Standard. They are of the Standard type, but have three very essential features which are different.

1. The body is made of steel pipe instead of iron casting, which reduces the weight more than one-half.
2. The pipe is screwed into the head and flanged to the base, and so the pump can be easily taken apart; this means that it can be shipped in a box, carried in several sections by hand, or transported on mule back into places inaccessible by other means of conveyance.
3. The price is lower than it has been possible heretofore to offer the Emerson Standard pump.

Side View

Emerson Single Cylinder Junior Pump

The Emerson Junior steam pump is especially adapted to pumping operations where the head or lift does not exceed 100 feet and the quantity of water to be handled ranges from 75 to 100 gallons per minute. For any service within the scope of its work, it is by far the most reliable and durable pump on the market.

One of the salient features of the Emerson Junior is the simplicity of its design and construction. This pump has fewer parts than any other and lacks all the delicate and intricate mechanisms common to other types. Although it is built extra strong and of the best material obtainable, it is lighter in weight and cheaper in price than any other pump of the same capacity. It takes up less room, requires less attention, and causes less expense for installation, operation and maintenance than any other steam pump. It requires no adjustments whatever to be made and has no packing glands, stuffing boxes, belts, pulleys, pistons, rocker arms or numerous other devices, which, in other types of pumps, cause the user endless trouble and expense. Its action is automatic. It requires no lubrication and works perfectly when taking large quantities of air in the suction. Gritty or muddy water does not damage it or interfere with its operation, and exposure to all kinds of weather does not affect it in the least. This pump midget requires less skill to operate it than any other type of pump and is capable of making long and continuous runs with scarcely any attention. The economy in its steam consumption is marked and in point of durability it has no equal in the pump world.

B	125.00	295	100	8	$3\frac{1}{2}$	$1\frac{3}{4}$	4	3

Emerson Junior

“Emerson” Steam Pumps

Front View

This pump consists of two chambers or cylinders with inlet and outlet valves for water; a circular slide valve for admitting steam alternately to each chamber; a small three cylinder engine for actuating slide valve; a condenser nozzle at the middle of each chamber, connected by pipes to the bottom of the opposite chamber and two air check valves at the top of each cylinder.

The water is forced from the chamber to a height corresponding with the boiler pressure available, by the direct pressure of steam, then the steam is condensed to form a vacuum and cause the chamber to fill again. One chamber fills while the other is discharging. The work is done solely by direct pressure of steam and by the vacuum produced by the condensation of the steam after it has been used once for expelling the water.

The rotary slide valve is driven by a small three-cylinder engine which is attached to the under side of the steam chest. The engine crank shaft extends into the steam chest in the center of the bearing around which the slide valve rotates and a positive geared connection is made by cut gears of steel and bronze.

Capacity given in table below is for 20-ft. head. For each additional 10 feet of head deduct 5 per cent.

“Pulsometer” Steam Pumps

A simple and durable pump for general service. Has no mechanically operated parts. The only parts in motion are a few check valves which are enclosed and operate automatically.

Action consists in alternately emptying and filling the two pumping chambers or cylinders by means of steam which first forces out the water in the cylinder by pressure after which the condensing of the steam produces a vacuum which draws in a new supply of water.

Price includes strainer, either basket or mushroom type, steam and relief valve, connections and pump hook for suspension.

Discharge Side

Ball Valve Pumps to order only—Prices upon request.

Duplex Power Pumps

Horizontal—Packed Piston Pattern

Geared 5 to 1

For Water Pressures 100 to 175 Pounds

A rugged, simple and high grade double cylinder power pump for boiler feeding or general service. The feature that stands out most prominently in this pump is the accessibility of all the working parts.

Grease lubrication is employed exclusively, compression cups being provided for all bearings.

Regular Fitted pumps have brass lined water cylinders, iron pistons and steel rods.

Brass Fitted pumps have in addition to the brass lined cylinders, brass or brass lined stuffing-box glands and bronze rods. Valve seats, springs and bolts of both styles are always of brass and valves of rubber or metal as preferred.

Motor driven pumps upon request. Specify voltage, phases and cycles.

Can also be furnished in the outside center-packed plunger type. Prices upon request.

The 8 1/2 x 10-inch has removable cast iron liners in water cylinder. Can also equip the 7 x 10-inch and 8 x 10-inch in same way at extra charge.

"Bulldozer" Power Pumps

Double-Acting—Double Geared

Driven by two pinions placed on same shaft. These pinions drive two gear wheels conveying power to the piston by means of a cross-head. Drive from both sides insures alignment.

Piston rods on all pumps are covered by heavy brass tubing and are outside packed.

Gearing on all pumps are machine cut from the solid.

Cylinders are all fitted with removable brass liners.

Wrist pins are brass bushed and fitted with oil cups. Suction may be taken from either side of the pump and air chamber can be set to discharge from any quarter.

Valves in the No. 500 are hard brass, of the poppet pattern with concave ground brass seats; in the balance of the sizes valves are hard rubber, with brass grid seats of the quick closing pattern with coiled spring.

Plungers are hump packed in Nos. 500-352 and 363; in the other sizes plungers are fitted with double cup leathers with a turned washer between them.

Nos. 362, 352 and 363 have guide for piston mounted on the head of the pump. No. 352 is considerably heavier than the others, being designed for very heavy work.

Nos. 352 and 363 are tested to 140 pounds, balance to 200 pounds pressure, at the factory.

The speed at which these pumps can be operated varies in accordance with the size of the pump and the elevation under which they are being operated.

All equipped with air chambers, T. & L. pulleys and pinion gear guards.

Simplex Plunger Power Pumps

Scotch Yoke Type—Single Acting
For Pressures up to 125 Pounds

Suitable for boiler feeding, pumping juices, molasses, paint and other thick liquids.

A simple and reliable pump, easily set up and kept up. Furnished with brass check valves, passing liquid through cylinder in either direction.

Crank pin has a steel roller and runs within the link shown. Valves are rubber and have brass seats.

Capacities rated at 50 strokes per minute. Nos. 2A and 3A geared 5 to 1; Nos. 8 and 9 geared 4 to 1.

Nos. 8 and 9 are single acting, Nos. 11 and 12 are double acting.

Style Nos. 1 to 7

When used for spraying we furnish outfit consisting of pump with pulley or gear, relief valve, pressure gauge, double shut-off, suction strainer, 10 feet of suction hose, coupled, two 10-foot bamboo extensions, two couplings, and two Misty Junior spray nozzles for \$143.75. Belt tightener at extra price.

Style Nos. 2A, 3A, 8 and 9

With Pulley

Geared Duplex Plunger Power Pump

Outside Packed Bronze Plungers
For High Pressures, 200 to 250 Pounds

For general water supply, operating large orchard sprayers. Geared 5 to 1.

The plungers, glands, followers, valves, valve seats and other working parts coming in contact with the liquid are of bronze.

Connecting rods are cast steel; crank and pinion shafts forged steel. Gears are machine cut, keyed and pressed onto the shafts.

With Gear

The crank shaft is extended beyond the main gear to provide for sprocket or pulley to operate agitator. Bearings are exceptionally large—the caps being held by four bolts; bearings are babbitted and are provided with grease cups. Air chamber is large for maintaining uniform high pressure.

No. 1603. Plungers 3x3 inches. Capacity per minute, 50 R. P. M., 9 gallons; 65 R. P. M., 12 gallons. Suction, 1 1/4 inches. Discharge, 1 inch. Pulley, 15x3. Size base, 10 1/4 x 14 inches. Weight, 310 pounds.

Price with pulley or gear.....\$112.50

Price with tight and loose pulley.....117.50

No. 500 Geared Vertical Duplex Plunger Power Pump

For Pressures up to 250 Pounds. Geared 5 to 1
For Spraying, General Water Supply, Etc.

This pump is outside packed. Air chamber inside of pump. It is compact, taking up but little floor space on account of arrangement of cylinders. All gears are machine cut from the solid iron. Bearings are accessible and lubricated by compression grease cups.

Pump has bronze covered plungers, bronze valve seats and valves with renewable rubber discs.

Channon Power Pumps

For Light Service

For pressures
up to 50 pounds.
Speeds 10 to 70
strokes per minute.

Fig. 81. Single Plunger

Fig. 82. Double Plunger

The above pumps are designed for any light service, such as filling tanks or any place where pressure does not exceed 50 pounds per square inch. Plungers are cast iron, valves of bronze. Pumps can be run either way and valves can be changed to make either side suction or discharge side.

Channon No. 4 Geared Power Pump

For pressures
up to 170 pounds.
Speeds 10 to 60 strokes
per minute.

Fig. 91. Single Plunger

Fig. 92. Double Plunger

Designed for continuous hard work, such as feeding boilers or in paper mills, tanneries or any place where a good, reliable pump is required.

The valves can be changed to suit the relative position of pipes or boiler, and pump can be run in either direction. Can be run as a double pump or two distinct and separate single pumps. Have brass plungers and valve seats and bronze or hard rubber valves. In boiler feeding will save about 50 per cent over an injector and 25 per cent over a steam pump.

Size 7x8 and Smaller

Style 957 Single-Acting Triplex Plunger Pumps

For 50 Pounds Working Pressure or 115 Feet Elevation

For tank pumping in mills, bleacheries, dye houses, tanneries, refineries, railway stations, etc.

Frame cast in one piece with cylinders, forming exceptionally rigid construction and accurate alignment of all working parts. Crank and pinion shaft bearings are babbitted.

Grade 5 to 1. Machine cut iron gears with gear guard. Connecting rods 7x8 and smaller have adjustable bronze boxes at crank end and bronze bushings at plunger end. Other sizes have strap head and wedge adjustment with bronze boxes at crank end and bronze bushings at plunger end.

Plungers are hard cast iron and inside guided.

Glands are iron and of easy access for adjustment.

Base and valve boxes in one casting affording large valve area, direct waterways and easy access.

Valves are rubber discs on bronze grid seats.

Air chamber supplied with pump.

Special construction to order—bronze plungers, lined cylinders and glands, rawhide pinion, etc.

Read gallons, speed and H. P. in order given, i. e., size 5x8 rating is 100 gals. at 49 R. P. M. takes 3.8 H. P.

Style 924 Single-Acting Triplex Plunger Pumps

For 130-pound working pressure or 300-foot elevation. For general water supply, municipal water works, pulp grinders, railway water stations, etc.

Same general description as Style 957 above.

Gear ratio is 5 to 1 except 9x10, which is 6 to 1.

Connecting rods are extra long with strap head and wedge adjustment with bronze boxes at crank end and bronze bushings at plunger end.

Valves are rubber disc on bronze grid seats, cylindrically wound springs. Metal valves as ordered.

Air chamber supplied with pump; vacuum chamber to order.

Special construction to order: Phosphor bronze plungers, lined cylinders and glands, rawhide pinion, etc.

Type 8½x10 and Smaller

Size, Inches		Gallons Displaced per Minute	Speed R. P. M.	H. P. 100 Lbs. Pressure	Displacement one Rev. of Crank Shaft, Gallons	Size Pipe, Ins.		T & L Pulleys, Ins.	Wght., Lbs.	Price

8½	10	300-350	44-51	21-24	6.94	6	5	36x6	6975	825.00
9	10	400	49	30	8.26	6	5	42x8	12000	1275.00

For high suction lifts select pumps to run at slow speed. To determine H. P. for increase or decrease in pressure multiply H. P. in tables by operating pressure divided by 50 for No. 957 and 100 for No. 924.

Style 1140 Single-Acting Triplex Plunger Pumps

For 130 Pounds Working Pressure or 300 Feet Elevation

For general water supply, municipal water works, boiler feeding, hydraulic elevators, mines, pulp grinders, etc.

Frame is cast in one piece with crosshead guides and cylinders, forming exceptionally rigid construction and accurate alignment of all working parts.

Crank and pinion shaft bearings are babbitted.

Geared 5 to 1—gears are machine cut from the solid iron.

Crossheads are babbitted and run in bored guides.

Connecting rods have adjustable bronze boxes at crank end, except $3\frac{1}{2} \times 4$ and smaller, which have babbitted boxes and bronze bushings at crosshead end. Plungers are hard cast iron and ground true.

Valves for cold water, rubber on bronze grid seats; for hot water we furnish special disc. Air chamber supplied with pump.

Special construction to order: Phosphor bronze plungers, lined cylinders and glands, rawhide pinion, etc.

To determine H. P. for increase or decrease in pressure multiply H. P. in table by operating pressure divided by 100.

Size 7x10

Style 1157 Single-Acting Triplex Plunger Pumps

200 Pounds Working Pressure or 460 Feet Elevation

For mine pumping, general water supply, waterworks, etc.
Frame is cast in one piece with crosshead guides and cylinders, forming an exceptionally rigid construction and accurate alignment of all working parts. Crank shaft and pinion shaft bearings are babbitted. Gear ratio is 5 to 1. Gears are machine cut from the solid. A gear cover or guard covers the pinion and adjacent teeth of the gear.

Crossheads 3½x6 and larger fitted with adjustable bronze shoes which run in bored guides, 3x4 have cylindrical crossheads of bronze.

Connecting rods 3½x8 and larger have strap head and wedge adjustment at crank end and adjustable marine type bronze boxes at crosshead. 3x4 and smaller have adjustable babbitted boxes at crank end and bronze bushings at crosshead. Plungers are hard cast iron, except size 1½x3, which has bronze plungers. Glands are cast iron, except size 1½x3, which are bronze.

Base and valve boxes are in one casting, affording large valve area, direct water ways and easy access. Valves for cold water are rubber discs on bronze grid seats; for hot water a special disc is supplied.

Special construction to order: Bronze plungers, lined cylinders and glands, rawhide pinion, etc.

Style 966 Portable Electric Triplex Mine Pumps

130 Pounds Working Pressure or 300 Feet Elevation
With Outside Packed Plungers

These pumps are of the horizontal triplex type designed for slopes, incline shafts or inside dips.

Made for any gauge of track—strong and compact. Three air chambers are used instead of one to reduce height. Any make of moisture-proof motor can be fitted. All working parts are provided with guards. Suction is taken from one end, but discharge can be taken from either side.

Crank shaft, pinion shaft and axle bearings babbitted. Pump and motor gears are iron—motor pinion bronze—all cut.

Connecting rods have strap and wedge adjustment with bronze boxes at crank end and bronze bushings at plunger end. Cylinders and valve boxes are in one casting; cylinders are bronze lined. Plungers phosphor bronze or hard iron as ordered. Glands, bronze lined or iron, as ordered—easy of access for adjustment and packing. Valves, rubber discs on bronze grid seats. Prices given include pump complete on truck, gearing necessary to connect to motor—but no motor. State gauge of track, height and current available.

To determine H. P. for increase or decrease in pressure multiply H. P. in table by operating pressure divided by 100.

Onoko Babbitt in your journals will show a profit on your ledger.

Forms of Triplex Pump Drives and Controls

Form "A" Drive, No. 1009 Pump

Form "A" Drive

An efficient form of short belt drive, consisting of bed-plate, idler, belt and driving pulley for belted connection to electric motor. Sizes $3\frac{1}{2} \times 4$ and smaller are regularly fitted with rawhide pump pinion; larger sizes to order.

Form "C" Drive and Control "K"
No. 924 Pump

Form "C" Drive

Consists of intermediate gearing, rawhide pinion and bed-plate for geared connection to motor.

Control "K"

Consists of by-pass with gate-valve, discharge check valve and relief valve. In boiler feeding pump is usually run at a constant speed, delivering enough water to supply the maximum demand, though the actual quantity required may vary.

By means of a gate valve in the by-pass the feed may be regulated, the surplus water returning to the source of supply.

Form "N" Drive, Silent Chain

Form "N" Drive

Consists of silent chain with sprockets and cast iron bed-plate to order for connection to electric motor.

Showing Control "L"

Control "L"

Consists of an automatic pressure regulator and by-pass which may be used when the demand on the pump is practically constant.

The pressure on the pump is controlled by the pressure in a compression tank. The regulator is adjusted to open the by-pass valve when the limit pressure is reached. When the pressure begins to drop, the by-pass closes and the pump discharges into the tank.

Other Drives

These pumps can also be furnished with other styles of drive—such as standard long belt drive; by means of friction cut-off coupling to gas engine or by flexible coupling to steam engine.

Fig. 780 Belted

Channon Centrifugal Pumps

Contractors' Type—Side-Suction—Heads up to 50 Feet

This is a very popular pump for contract and other work, as it is extremely simple, will handle large quantities of water, is not affected by mud or grit and will pump a fair percentage of sand and other foreign matter without appreciable wear. There are no valves of any kind to get out of order.

Pump consists of the case or shell with one moving part—the runner or impeller—revolving inside of it.

The inside of the shell is machine finished and the runner is also machined and accurately fitted to it, giving a close running fit and greater efficiency than with the old style split case pumps.

Discharge may be adjusted at any angle.

Pumps hot or cold liquids equally well.

No expensive foundations are required, as the pump receives the liquid without shock or jar and delivers it in a continuous steady stream.

Hand Suction Primer, shown at left, can be furnished if desired at extra price, though an ordinary hand pitcher pump may be used for the purpose.

Hand Primer

Size No.	Disch. Pipe, Ins.	Suct. Pipe, Ins.	Capacity, Gals. per Minute	Belt Pulley, Inches	Std. Speeds		Approx. Wt., Lbs. Fig. 780	Extra for Hand Primer	Price Std. Pump Fig. 780

Class A and E Single Stage Centrifugal Pumps

Horizontal—Belt Driven

Class "A"—

Low pressure—single stage. For total heads up to 65 feet.

Class "E"—

High pressure—single stage. For total heads up to 125 feet.

These pumps are of the volute type and highly efficient. Flow lines are reduced to the easiest possible curves, with least cavitation.

The Class E pumps have ball-bearing end-thrust, while the Class A has plain collar.

Brass fitted or all brass pumps quoted on request.

Below we are giving partial horse power table for reference, but the horse power depends upon the quantity of water as well as the head and care should be exercised on all installations. We supply full data upon receipt of information.

Sizes smaller than 2-inch have screwed connections. Larger sizes upon request.

When asking for information be sure to give all conditions.

Centrifugal Sand and Gravel Dredging Pumps

Fig. 1005—Standard Belted Pump

Fig. 1010G—Direct Connected to Steam Engine

Dredging by means of the centrifugal pump is a well established successful method—the high velocity of the sand and gravel passing through the pump disintegrates all earth and decayed stone which passes off with the water. This style of pump is largely used by bridge and railroad contractors for pumping out caissons where the water contains sand, coal, decayed vegetation, etc., which would make the ordinary plunger pump or even a centrifugal water pump unsuitable. All stuffing boxes are tapped for water connection and have water sealing ring fitted with grease connection.

Class P—Single Stage Centrifugal Pump

Heads up to 125 Feet

With bearings entirely removed from the volute chamber and so designed that it is impossible for the water pumped to get into them.

Especially designed for pumping water containing sand or fine grit.

The bearings are very wide. The shaft is carried on two ring-oiler bearings with removable split liners. Between these two bearings is a ball thrust bearing for end thrust.

The gland is water-sealed and provided with drip pocket. Pump is of very rigid design.

Special Pumps

Fig. 1921. Single stage, horizontal, direct connected by flexible shaft coupling to motor. Heads up to 125 feet.

Fig. 1002. High pressure, double suction, enclosed runner, horizontal split volute, single stage, direct connected to electric motor.

Fig. 1003. High pressure multiple stage pump with horizontally split volute, enclosed runner on base for motor drive. Shows three stage pump for 375-ft. head.

Fig. 1018. Double suction drainage pumps, 20 to 60-inch. Belted or arranged for direct engine connection.

When inquiring for special pumps—be sure to state capacity desired, both vertical and horizontal distance in feet, giving vertical distance from level of water to point of discharge, give length of suction pipe, also total number of elbows, valves and other fittings; state whether liquid contains alkali or acid and whether free from grit or sediment; state kind of power used; if electrical, give voltage, phases and cycles.

We have Pumps for every Requirement.

Fig. 900—Steam Driven Centrifugal Pumps

These outfits are compact and portable and used where but little elevation is required 20 to 30 feet maximum head.

Vertical Centrifugal Pumps

Type C.—Low pressure, single stage, vertical shaft, centrifugal pump, with ball bearings and stuffing box. Usually installed above water level. Pump is regularly furnished with flanged coupling, but clutch coupling can be supplied for special conditions. For total heads up to 50 feet.

Type G.—High pressure, single stage, vertical shaft, centrifugal pump, with ball bearings and stuffing box. When submerged, couplings and ball bearings are arranged as the submerged Type C. For total heads up to 100 feet.

We have pumps for every requirement

Arrangement of Shafting for Driving Our Vertical Centrifugal Pumps

The illustration on this page shows the usual arrangement of shafting to drive our vertical centrifugal pumps in deep pits, trenches, etc. Each length of shaft is provided with two bearings and the set collars so placed above each bearing that the weight of each section of shafting is carried on its own bearings, thus removing the weight of shaft from the pump. Jaw couplings connect ends of the shaft. The standard length of each section of shaft is 20 feet. Shorter lengths can be supplied as needed. Great care should be taken to see that the shafting is properly lined up with the pump, as most difficulties experienced with vertical pumps are caused by improper setting of the pump and shafting.

Runs on Gasoline or Kerosene Heads
20 to 25 Feet

A light, compact, air cooled engine, direct connected to a centrifugal pump, high tension built-in flywheel magneto, two cylinder opposed type, non-vibrating.

By mounting this outfit on two skids it can readily be carried to any place on the job by two men.

Capacity, Gals. per Minute	Capacity of Pump		H. P. of Engine	Actual Weight, Pounds	Price
	Disch., Inches	Suction, Inches			
125	2	2 1/2	3	150	\$125.00
200	3	3 1/2	5	250	185.00

The Evinrude Unit Centrifugal Pump

It has but one moving part—the impeller. The large open passages and the absence of valves, sliding and reciprocating parts enables it to handle semi-fluids and water containing gritty or solid matter in large quantities at low cost.

Its low price, simplicity, compactness and low fuel cost have made it a very popular equipment. It requires only 17 1/2 x 24 inches floor space, weighs 133 pounds and can be easily handled by two men.

An engineer is not required to operate it. Any man on the job can do so. It is direct connected and no power is lost.

The ignition is built in the flywheel, and so insulated that the magneto cannot be affected even by a drenching rain.

The lubricating oil is mixed with the gasoline, no oil cups are used. In the two horse power size one gallon of gasoline will run the pump for four hours.

The pump is set right down in the excavation and submerged in the water. No suction pipe—no priming. Start the motor with a half turn of the flywheel and the pump starts the water.

Average capacity of a 2 H. P. pump, 2400 gallons per minute against a 25-foot head.

Centrifugal pump, complete with 2 H. P. motor..... \$ 87.00
With 3 1/2 H. P. motor..... 140.00

Pump with 2 H. P. motor, net weight, 133 pounds; with 3 1/2 H. P. motor, 167 pounds.

Capacity Curves of an Evinrude 1 1/2-inch Centrifugal Pump

Zin-Ho Centrifugal Pumping Outfit

Direct Connected, Gasoline Driven

Magnet Side

The Pump has 3-inch discharge and 4-inch suction and is equipped with a ball thrust bearing to take the end thrust of the runner. It is connected to the engine flywheel by means of an arm coupling, the whole being rigidly mounted on a substantial sub-base.

This is not a sand-pump but it will handle a small amount with the water.

May be fitted with foot valve so it may be primed. Supplied in brass lined or all brass at extra cost.

The Engine can be disconnected and used for other purposes, running a belt from the flywheel to a generator or to any machine desired to be operated. In this way it can be kept at work in case the pumping operation is not continuous.

Every part is thoroughly tested before leaving the factory and is fully guaranteed to develop the full power and run steady. Any part proven to be defective will be replaced free of charge F. O. B. factory within one year from date of purchase.

Capacity 265 gallons per minute, 55-foot total head, 4-inch suction, 3-inch discharge, speed 1000 R. P. M., weight 550 pounds net.

List price.....\$347.00

Regular equipment has cooling water pipe connected from pump to engine. Cooling tank or separate circulating pump charged extra. Extra charge for muffler if furnished.

The standard equipment as described is carried in stock at all times. Larger sizes built to order.

Pormo Portable General Utility Engine

Runs on Gasoline or Kerosene

For operating pump standards with a light compact efficient engine. Two cylinder opposed type, air cooled. High tension built-in-flywheel magneto.

Owing to its light weight it is a very desirable engine to use for this work, as it may be removed by unscrewing four lag screws and used for sawing, churning, cream separating or general utility work.

Directions for Setting up and Operating Centrifugal Pumps

Cut A

Set the pump as close to the water as possible and arrange both suction and discharge pipes to use as few elbows as possible. Never set the pump more than 20 feet above the water.

Warm water cannot be lifted as high by suction as cold water and very hot water must flow to the pump.

Be absolutely sure that every joint in the suction pipe is tight. Before starting, the pump and suction pipe must be entirely filled with water to prime the pump. The best method of doing this, if steam is at hand, is by means of an ejector and either a flap valve on the discharge or a foot valve on the suction. Cuts A and B show the arrangement and piping of the ejector in both cases. If a flap valve is used (Cut A), open the suction valve A and then the steam valve B. Allow the ejector to work until a good stream of water is discharged at C. Close the suction valve A, then the steam valve B and start the pump. Be sure to close valve A first.

If a foot valve is used (Cut B), open the discharge valve A and then the steam valve B. Allow the ejector to work until the pump is entirely filled. Then close the valves and start the pump. If steam is not available, a foot valve as shown in cut B may be used and the pump filled at the opening in the top of the shell by means of a hose or by pouring in water.

On 8-inch and smaller pumps, a hand suction primer may be used, but we do not recommend it for sizes above 8 inches.

See that the pump runs in the direction of the spiral. Drain the pump in cold weather to prevent freezing, by unscrewing the plug in the bottom of the pump shell.

Electric Centrifugal Pumps

Or Automatic Sewage Ejectors

Entirely automatic, and as the pump is constantly submerged, no priming is necessary. The motor is controlled by a float which starts automatically when the liquid reaches a given height in the pit and stops when it is empty. The pump, discharge pipe, etc., are supported from the pit cover and all parts can be inspected or removed by simply lifting this cover. The pit may be of iron, brick or concrete.

We are prepared to furnish pumps of **any capacity** to suit **any conditions**.

Inquiries should state the character and amount of liquid to be pumped, the diameter and depth of pit, total height and distance to point of discharge.

Regular construction includes pump and pit cover, for pit 5 feet deep, together with motor and float switch which can be mounted on adjacent wall or on the cover plate.

Specifications and Prices

Based on pumping against a total head of 15 feet.

Electric Automatic Condensation Boiler Feed Pump and Receiver

Automatically handles the condensation in heating systems, separates the air from the water, venting the air and returning the water to boiler at high temperature. By quickening the circulation of steam through entire system it effects a considerable saving in heat units.

A unit consists of receiving tank, centrifugal pump and automatic switch.

The switch is simple and durable, 1, 2 or 3-pole, no trunnions, weights or pulleys used in its construction. Automatically starts the motor when condensation reaches a predetermined point in the tank and stops when water has been discharged into boiler.

Centrifugal Mine Sinker Pumps

The pump is direct connected to vertical type motor which is protected from dripping water or falling rock by a metal hood.

The pump is suspended by rope, chain or cable and lowered as the shaft progresses.

It is very compactly built and mounted with motor in a rectangular channel frame.

We are prepared to furnish these outfits of any capacity and to suit any conditions.

Prices on application.

The "Emerson" Quick-Cleaning Strainer and Foot Valve

It is never necessary to take up suction pipe to clean strainer. No hinges or springs to get out of order. Applied to suction of any pump. Intake areas largely exceed size of pipe. Cannot cock or clog the valve. Strainer always seats itself properly. Easy to clean and keep clean.

The strainer is made of heavy perforated flange steel, the perforations being 7-16 inches in diameter in all sizes above four inches, and is riveted to a substantial top casting having a collar that fits loosely around the suction pipe, so that it can slide up and down without cramping, and the suction pipe acts as a guide. It is raised and lowered by the ropes, as shown.

The foot valve operates freely in guides cast into the valve body, making it possible to get large and generous openings through the valve with only a low lift of the gate, which prevents hammering and shocks.

"Viking" Rotary Pumps

Elevations up to 150 Feet—Requires no Priming

It has a positive action and a wide range of speeds. May be run in either direction and either port may be used for suction.

Referring to the sectional view shown—pump consists of two gears—the only moving parts—one, the outside or annular gear, revolves within the casing and is driven by the power pulley. The smaller gear, driven by the larger or internal gear, is set off center and meshes so that its outer circle is tangent to the outer circle of the larger gear at the center of the abutment or crescent shaped piece between the inlet or outlet. The crescent projection fills the space between the outer circle of the small gear and the inner circle of the large gear. The head and crescent projections are cast in one piece which also carries the spindle or shaft for carrying the smaller or idler gear.

After the water enters the pump it is carried around the pockets formed by the spurs of both gears and the crescent shaped abutment. When the gears begin to mesh, the water is forced into the discharge port. The crescent shaped abutment between ports then prevents its passage back into the entrance port, so that it must go on into the discharge pipe.

Special Oil Outfits

Single pumps, capacity 100 G. P. M., without power units. Price iron, \$113.50. Brass fitted..... \$133.50

Double pumps, capacity 100 G. P. M., each, gears and clutches, will operate with gasoline engine or motor, without power unit. Price iron, \$180.00. All brass..... \$208.00

With motor or engine, price on application. Give electric current if direct or alternating.
Brass fitted are working parts brass. High pressure heads, motor base, and power unit for direct connected or gear driven, additional cost. Price on application.

Notes.—Repair parts are proportioned so it costs practically the same as a whole pump. All brass pumps have iron base, pulley and standard.

Style of Nos. 6 to 13 Pump

Blackmer Rotary Pumps

Pressures up to 100 Pounds

Referring to the interior view, "B" is the piston and "C" the buckets. As the piston revolves the buckets are thrown out against the inside of the casing. Buckets drop into the extension chamber—lower part of cylinder or casing—at left and pass to the right, drawing in at suction and forcing out at discharge port.

Wear is automatically taken up by the buckets until they are completely worn out.

Lined pumps have removable liners for the inside of the casing.

Interior View

Bronze quotations subject to market fluctuations of metal.
Bronze pumps upon request. Tight and loose pulleys are extra.

We have a pump for every requirement.

Power Rotary Force Pumps

Fig. 120

For Elevations Up to 100 Feet, Speeds Up to 150 R. P. M.

Fig. 120

This is the ordinary commercial rotary pump for intermittent work. Used largely for circulating purposes, and for creameries, dairies, refineries, factories, etc. Pumps a steady stream.

For discharging to an elevated tank, the cap on the top can be removed and placed on end of goose neck, and pipe connected to discharge straight up from pump.

For pumping acids, bronze pumps should be used, and when intended for hot liquids, should have metal check valves. Drip plugs are provided for draining pump in cold weather.

Showing Cams

Fig. 121

This is an improvement of the Fig. 120. It has both shafts extended through pump case, the four ends being supported by babbitted box bearings bolted to bed plate. This arrangement produces a much more durable and efficient pump, holding the cams in perfect alignment, and permitting of proper external lubrication. The suction may be taken at either side or underneath.

Fig. 121

Bullock

Bullock

For Elevations Up to 250 Feet or Equivalent Pressure. Speeds Up to 300 R. P. M.

Rotary pumps are popular, but one drawback of the cheaper varieties in the past has been their comparative short period of usefulness.

To overcome this, the Bullock pump is a still further development, exterior driving gears being added to relieve the strain and wear on the pumping cams. The driving gears are machine cut, and placed on the shaft between the outer bearings and pulleys, and are provided with gear guard.

*Bronze pumps have all parts coming in contact with liquid made of bronze.

†Figs. 121 and Bullock No. 4 pumps have 1 1/2 or 2-inch suction. No. 5 pumps have either, 2, 2 1/2 or 3-inch suction.

Shafts on Nos. 1, 2 and 3 are 1 1/8-inch diameter, Nos. 4 and 5, 1 1/4-inch diameter.

At a small additional cost these pumps can be especially fitted for pumping oils or gasoline.

Rotary Geared Circulating Pumps

For Oil or Water

Adapted for circulating cooling water on gasoline engines, for distributing oil on machine tools, etc. Very simple—just two accurately cut gears operating together in a machined and close fitting case. The cams or gears are milled to gauge on automatic machines. Regularly equipped with flanged pulley, as shown, but can be arranged with flat face pulley, sprocket or gear as desired.

Fig. 2356

It permits supply being cut off at discharge without stopping pump and saves money because it is not necessary to buy an independent relief valve to complete circulating system.

To obtain best results, pump should be placed as near as possible to the level of oil in tank and a check valve and strainer used on suction pipe.

Fit these pumps to the machines you use—furnish them with the machines you make—and you'll never have trouble at this end of the circulating system.

Relief Valve

Fig. 2356

This pump is not reversible and has no relief valve, a check valve in suction pipe being used.

It is extensively used on gasoline engines for circulating cooling water in the cylinder jacket, and on machines operating cutting tools only in one direction. It is recommended in all such cases where a relief valve is not needed.

Fig. 2357

Same as Fig. 2356, except that the direction of rotation may be reversed without changing the direction of the stream.

Fig. 1850

Is the same in all respects as Fig. 2356, except that it is equipped with relief valve concealed in the face plate of pump.

Fig. 1850

Fig. 1854.

This pump is similar to Fig. 1850 in material, workmanship and efficiency, but being reversible, it is equipped with double instead of single, automatic relief valve.

Used principally on machines operating cutting tools which reverse, such as automatic screw machines, lathes, etc. It will reverse automatically with machine delivering a continuous uniform flow of oil.

Also furnished without relief valve when valve is not needed.

Channon Portable Diaphragm Trench Pumps

Non-Chokable and Frictionless

For Pumping Dirty or Gritty Water

Side Suction

Nothing to wear but the rubber diaphragm which is quickly and cheaply replaced.

"We guarantee our Channon diaphragm pumps to handle more water with less labor and fewer repairs than any other pump of this class made."

We have been manufacturing these pumps for the past 20 years. They are popular in all sections and known as "Sewer Pumps," "Bilge," "Trench," "Mud," "Sludge," "Ditch Pumps," etc.

You will find them wherever you go on sewer, trench and foundation jobs of all kinds.

Operated by up and down movement of a long lever which raises and lowers a rubber diaphragm which is the only part that wears out. When worn it is quickly replaced at a cost of \$2.50 for the 2½-inch, \$3.00 for the 3-inch and \$4.00 for the 4-inch size.

The Channon diaphragm pump is of extremely simple and rugged construction—a rubber diaphragm and two check valves, supported by a strong cast iron casing. There are no pistons or plungers, vanes or springs—no parts in rubbing contact.

The water ways are large, direct and open and will quickly dispose of large quantities of drainage or sewage matter, sanitary deposits, mud, gravel and quicksand. This pump takes out the last inch of water—as it requires no priming—and for this reason is used in many large excavations after some other style of larger pump has been used for unwatering.

The handle socket is reversible and can be used on either side of the pump.

Rubber seated check valves provided above and below the diaphragm for holding the water.

We make three sizes to take 2½, 3 and 4-inch suction. The 3-inch size is the most popular for hand work. Very few of the 2½-inch size are sold. The 4-inch requires two men.

Channon Portable Gasoline Engine Driven Trench Pump

A hand pump requires at least two laborers to keep going all day. This labor cost may be saved by purchasing one of our outfits which will usually pay for itself in about thirty to sixty days.

The capacity is four or five times greater than is obtainable by hand.

The diaphragm pump is fully described on a preceding page.

The gasoline engine, which is three horse power, is extremely simple and rugged and made for out-door use. The water for cooling the engine is contained in an open jacket, surrounding the cylinder, making the outfit self-contained.

No wood enters into the construction of this equipment. It is built on a substantial steel truck and is fully equipped, ready to run.

Complete outfit includes Edson type side suction, open side discharge, diaphragm pump with gasoline engine connected, complete as shown in cut. A 15 foot section of Bullock special rubber suction hose with nipples wired in or with couplings and clamps, suction strainer, wrench, and one extra rubber diaphragm—all ready to run.

Sizes and Prices

Outfit with 3-inch pump, 15 ft. hose, etc., weight about 900 lbs. \$186.66

Outfit with 4-inch pump, 15 ft. hose, etc., weight about 950 lbs. 240.00

These outfits carried in stock for immediate shipments. We carry hose in stock in lengths of 10, 12, 15, 18, 20 ft.

Channon New Diaphragm Force Pump With Closed Discharge No. 3

May be used on all work usually taken care of by the open spout type. Discharge fitted for hose or pipe and permits forcing the water to an elevation of 15 ft. above the pump, so that water can be lifted and forced against a total head, including suction and discharge, of 40 ft. A durable pump for handling large quantities of muddy and gritty water, sewage or semi-fluids. Equipped with an air chamber to steady the flow.

The Standard outfit includes a lever for hand operation, but pump may also be arranged with a jack for power operation.

Specifications

Stroke 3 inches; suction and discharge 3 inches; displacement per stroke, .75 gallon; approximate weight 200 lbs. Price.....\$30.00

Channon Diaphragm Pump

For belt or gear drive

date the speed of the engine. Fitted for side suction, 1 or 1½ horse power sufficient for ordinary service.

For pumping out excavations, cellars, trenches, quarries, or similar services where a portable power diaphragm pump is desired. The pump is back geared 5 to 1 and can be belted or geared to any engine with suitably proportioned gearing to accommodate the speed of the engine.

No.	Stroke, Ins.	Suction Pipe, Ins.	Displacement per Revolution, Gallons	Number of Revolutions Recommended	Apprx. Wt. in Lbs.	Fig. 1642 Price
3	2 1/4	3	.8	35 to 50	210	\$54.00
4	3 1/4	4	1.2	35 to 50	320	90.00

Channon Power Driven Diaphragm Bilge Trench Pump

New Improved Style with Worm Gear Drive

A portable power driven diaphragm bilge trench pump, mounted either on skid or truck, for the use of contractors and builders in pumping water from footings, trenches, cellars, cofferdams or on public works where it is necessary to raise large quantities of water. This pump is especially adapted to pumping muddy or gritty water.

This pump was designed from start to finish as a power pump, and each part was made with this end in view. It is not a hand pump connected by gearing and levers to an engine.

The pump is driven by a worm gear direct connected through a flexible coupling to the engine. In this way the entire speed reduction from engine to pump is made by means of one pair of noiseless gears. The worm and worm gear are enclosed in a dust-proof housing which is packed with grease.

The pump diaphragm is operated by an overhead crank carried in two liberal bearings.

The suction valve is rubber faced and can be easily removed for cleaning.

The discharge valve is of the vertical type which gives a much freer discharge than the flap valve generally used.

The engine was designed especially for this outfit. The crank case is entirely enclosed, making it dust-proof.

The ignition is of the jump spark type, equipped with the latest improved high tension magneto, direct geared to the engine.

The gasoline tank is formed by the sub-base, making a leak proof tank.

This sub-base also forms the base of the pump, making a very rigid and compact outfit.

The entire outfit only occupies a space two feet wide by three feet long, and weighs less than five hundred pounds.

The capacity is 3000 gallons per hour with the 3-inch suction pump, and 6000 gallons per hour with the 4-inch suction pump.

Pump No.	Water Cooled 4-Cycle Engine	Side Suction Pump	Pump Capacity per Hour	Net Weight of Outfit Complete on Skid	Shipping Weight of Outfit Complete on Skid	Price Complete on Skids	Price Complete on Truck
3	2	3	3000	475	550	\$180.00	\$200.00
4	2	4	6000	525	600	200.00	220.00

Cut on left shows the pump mounted on truck.

The truck frame is formed by the standard skids and can be attached to the skidded outfit at any time by means of six bolts.

The rear axle is carried by two cast brackets bolted to the side of the skids. The front axle is reinforced by a casting which forms the fifth wheel and is fastened by means of a king bolt to a piece of channel iron bolted to the under side of the skid.

The rear wheels are 14 inches in diameter and have a 3-inch face.

The front wheels are 8 inches in diameter with a 3-inch face.

Channon Diaphragm Force Pumps

Odorless

This pump is entirely enclosed by an air chamber and is designed for pumping out sewers, cess-pools, vaults and for handling dirty or gritty water or other disagreeable fluid or semi-fluid in a sanitary manner.

Also used for jetting or sinking piles and poles in sandy soil. The general construction, as will be seen from the sectional cut, is similar to that of our open top diaphragm suction pumps described in the preceding pages.

A rubber diaphragm with a special valve acts as a plunger—the inclined rubber faced suction valve offers the least obstruction to the passage of matter.

This is the simplest type of pump made—there is nothing to wear but the diaphragm which is easily and cheaply replaced. The diaphragm creates suction by an up and down movement and there are no complicated parts to get out of order and no sliding contacts to become worn by gritty materials.

The waterways are large and permit an easy flow of the fluid. Pump has convenient hand hole for getting at interior without removing the air chamber.

The hand levers are of wrought iron and reversible.

The stroke is short and operates easily. Suction and discharge openings are threaded for standard and iron pipe thread.

Pump with Jack and Pulley for Belt Drive

Pump on Truck with Gasoline Engine Drive

"Jackson" Double Cylinder Hand Force Pump

Lift and Force 75 to 150 Feet

A simple lever pump adapted for a large variety of uses about factories, residences and for general service.

The capacity is large and but little manual power is necessary to deliver the maximum quantity of water.

There are two cylinders with leather packed plungers which contain brass poppet valves; the suction valves are of leather.

The plungers operated alternately by the long malleable iron lever produce the same effect as the double-acting pump.

The lever can be placed on the shaft in four different positions.

Pump furnished as shown at the left with lugs cast on each side of the case for the purpose of securing to wall, post or plank. Can also be furnished with base as shown in right hand cut. Net extra for base, 50 cents.

Can be furnished with air chamber and cock spout at extra price. Metallic valves extra.

Fig. No. G—

For towns and villages without waterworks

Village Fire Engine

Swan Neck Type—With Gun-Metal Cylinders

Consists of a powerful pump, substantially mounted on a truck. Can be moved from one location to another by from one to four men and can be operated to its maximum capacity by 6 to 10 men, and with this force an effective fire stream can be thrown with ¾-inch nozzle opening from 50 to 70 feet vertically and from 60 to 90 feet horizontally.

The extreme distance that it will throw water is not material for protection—to put out fires—city fire departments do not depend upon the distance the engine will throw, but on the hose, carrying the nozzle as close to the flames as possible and delivering the greatest quantity of water possible on the flames. A sprinkling of water from the end of a 75 to 100-foot stream only creates gas that aggravates the flames—use hose and get the water to the flames.

Sizes and Prices

No.	Size of Cylinders, Inches		Suction Fitted for	Discharge Fitted for	Weight, Pounds	Capacity per Rev., Gallons	Price Without Hose, etc.
	Diameter	Stroke					
4	4½	6	2½-inch hose	1½-inch hose	600	.83	\$350.00
5	6	8	3-inch hose	2-inch hose	800	1.96	480.00

A complete outfit consists of pump and 25 feet of suction hose with couplings and strainer, and from 100 to 500 feet rubber lined cotton fire hose, with automatic couplings and screw tip nozzle.

For fire hose, couplings and nozzles, see index.

Hand and Power Piston Force Pump

For deep and shallow wells

Especially Serviceable in Creameries and Cheese Factories

Pump as shown is arranged for power only—to change to hand power, remove pulleys and substitute a hand wheel.

The barrel forms the cylinder in which a plunger is operated by a crank-shaft and pitman, both enclosed below the air chamber. The pump may be used for shallow wells without the use of a lower cylinder.

For deep wells, plunger and the lower valves are omitted—plunger guide is substituted and a connection provided for rod to extend down into well attached to a cylinder.

Cylinder is 3-inch by 5-inch stroke, suction $1\frac{1}{2}$, discharge $1\frac{1}{4}$ inches, pulleys 16x3, tight and loose.

Fig. 230. Hand power. Price each \$23.00
Fig. 231. Power pump. Price each 27.00
Out-board bearing furnished at \$4.00 extra.

We must know whether this pump is to be used for deep or shallow wells—see above.

Fig. 230 for Power

Fig. 230. Hand power. Price each \$23.00
Fig. 231. Power pump. Price each 27.00
Out-board bearing furnished at \$4.00 extra.

We must know whether this pump is to be used for deep or shallow wells—see above.

No. 149 Sanitary Milk Pump

Unexcelled for Creameries—Easily Dismantled
Readily Cleaned—Operates Smoothly and
Noiselessly—Speeds 100 to 200 R. P. M.

Face plate is attached to case by two malleable clamps—quick detachable and providing ready access to working parts of pump.

Cams are removable and encased in an accurately machined cylinder. Has tight and loose pulleys.

Size No.	Capacity 100 R. P. M. Gallons	Suction, Inches	Discharge, Inches	Size of Pulleys, Inches	Price Each

Plumbers' Brass Force Pump

Brass cylinder and brass plunger leather packed, with brass case check valve and hose coupling. In operating this pump a hose is connected to pipes to be cleaned, and pump is set in a vessel of water.

No.	Diameter Cylinder, Inches	Discharge Hose, Inch	Price Each
0	2	$\frac{3}{4}$	\$12.00

Boiler Test Pump

Hand-Power Bronze-Fitted

This is a substantial double-acting pump, capable of being worked by one man against 500 pounds pressure. It has brass piston (packed), brass piston rod and forged connections.

Piston 2 inches in diameter.

Length of stroke, 5 inches.

Suction for 1-inch pipe.

Discharge for $\frac{3}{4}$ -inch pipe.

Weight 60 pounds.

Repacking or cleaning out is conveniently done by simply unbolting and lifting the pump off its base.

Price each \$35.00

Hydraulic Pressure or Test Pump For Testing Boilers, Pipes, Etc.

Cylinder and base cast in one piece. Suction and discharge valves have brass valve seats, poppets and caps, and are flanged and bolted to cylinder. Revolving top. Sectional lever with link.

Fig. 867

No.	Stroke, Inches	Suction and Discharge, Inches	Working Pressure, Pounds	Price Each

3	17	$1\frac{1}{4}$	$1\frac{1}{4}$	65	60.00	21.00

Price includes 3 feet of suction pipe, hose coupling, hook and patented holder, but no hose.

Double-Acting Suction and Force Pumps

Fig. 276 Monarch Double Lever Pump

Adapted for fire protection in factories, residences, for filling and cleaning boilers, for washing decks, etc., on dredges and boats. For use anywhere as a suction and force pump against pressures up to 125 pounds.

Pump comes mounted on wooden plank as shown and is fitted for both iron pipe and hose connection.

Cylinders are brass-lined; valves, valve-seats and piston rods are bronze and are accessible by simply removing the two toggle bolts holding the air-chamber.

Lever and sockets are malleable iron. The valves are in pairs, one set above the other, producing maximum efficiency. Very best materials throughout.

Diameter Cylinder, Inches	Length Stroke, Inches	Suction, Inches	Discharge, Inches	Weight, Pounds	Price Each
5	6	2½	2	200	\$55.00

Fig. 275 Monarch Single Lever Pump

Same description as Fig. 276 but smaller size. Single lever and socket are malleable iron.

Suction fitted for both iron pipe and hose.

Cylinder is 3-inch diameter by 5¼-inch stroke, suction 1½, discharge 1¼ inches. Weight, 100 lbs. Price.....\$13.00

Boiler Feed Pump

For supplying water to boiler where city pressure will not overcome boiler pressure. It permits the city water to run through without interference, and is only used when the pressure will not operate against the boiler pressure.

The pump will work against a pressure of 300 pounds.

Iron cylinder, plunger brass tubing.

Price.....\$15.00

Fig. 387 Rockford Single Lever Pump

Ratchet Handle

This model combines recognized good points in construction and design with original and practical features. Some recognition of the merits of this pump will be gained from cut and the detailed description following.

Cylinder is brass lined and is of sufficient length to give a 4-inch stroke.

Suction and discharge openings are provided at both sides of pump, making possible connection from either side as condition may require. The heads attach to flange on cylinder with four ¾-inch cap screws. The joints are perfectly tight, both the flange and heads being faced and fitted with rubber gaskets.

Valves. The four valves are of brass with leather discs and rest on brass seats in pairs, one set elevated to retain prime.

All valves are accessible and can be readily removed by unscrewing caps.

Plunger. Consists of three cast iron followers machined to fit the cylinder accurately and equipped with two best quality cupped leathers. Is attached to brass covered piston rod operating through brass stuffing nut in head.

Ratchet Head. This style of head is conceded to be very practical for horizontal double-acting pumps as it reduces the leverage and requires less power to operate. A strictly high grade pump in every way.

Diameter Cylinder, Inches	Length Stroke, Inches	Suction Pipe, Inches	Disch. Pipe, Inches	Weight, Pounds	Price Each
3	4	1½	2	100	\$16.50

Supplied with air attachment for air pressure systems for \$2.00 net extra.

No. 118 Hand Rotary Force Pump

With Pedestal Base

The fly or balance wheel measures 14½ inches in diameter and can be operated by the average man at the rate of 75 revolutions per minute.

The pedestal elevates the pump to a convenient position for operating.

Will draw water or other liquid 15 feet and force to an elevation of 75 feet.

By removing cap on upper discharge and placing same at end of spout discharge pipe can be connected for elevating water.

Size No.	Cap'y Gals. per Min.	Suction, Ins.	Discharge, Ins.	Diameter Balance Wheel	Weight, Pounds	Price Iron Pump
1	13	1½	1	14½	68	\$15.50
2	14	1½	1	14½	75	17.50
3	17	1½	1½	14½	85	23.00

"Bullock" Double Acting Tank Pump

This pump is radically different from the ordinary run of agricultural tank pumps—it was designed with the intention of producing the best, most accessible and durable pump of this type on the market.

The Bullock tank pump is exceptionally heavy—each individual casting or part is reinforced—giving double strength throughout and producing a practically indestructible pump capable of withstanding the most severe requirements.

It is compact, "low-down" and with all working parts easy to get at—all important essentials in tank pump construction.

The Cylinder—is bored full 5 inch diameter and polished—fitted with seamless drawn brass lining also fitted with brass drain plug. Both ends of the cylinder are flanged to receive the front and back head, either of which can be easily removed at any time by loosening the cap screws. The joints at front and back are perfectly tight, both the cylinder flanges and heads are faced true and fitted with rubber gaskets. The suction is fitted for 2 inch diameter iron pipe also with union coupling for 2 inch hose. Discharge is fitted for 2 inch pipe also with union coupling for 2 inch hose. The stroke of the pump is 5 inches.

Valves—The four valves are of cast iron turned up on a lathe and ground onto brass valve seats, in separate boxes and in pairs—one set of valves elevated above the other to retain the priming.

All the valves are easily accessible and can be removed by unscrewing the caps.

Plunger—Consists of three cast iron followers machined to fit the cylinder accurately and are equipped with two 5 inch best quality cup leathers. Plunger is attached to polished cold rolled piston rod operating through brass stuffing box nut in cylinder head.

Ratchet Head—This style of head is conceded to be the most practical for horizontal double-acting pumps, as it reduces the friction and requires about 50 per cent less power to operate than the ordinary fulcrum cap. On either stroke of the handle the cogs or teeth engage at a point directly in line with the center of the piston rod—as a result the piston operates in a direct horizontal position with the least possible friction—rod guides hold piston in perfect alignment.

Bullock Tank Pump—Capacity 25 gallons per minute, with brass lined cylinder 5 inch diameter by 5 inch stroke, suction and discharge both for 2 inch pipe or hose. Weight

\$16.00

5 inch stroke, ratchet handle, suction and discharge both for 2 inch pipe or hose. Weight 110 pounds. Price.....

Bullock Special Oil Pump

Made specially for handling oils from tank cars to tank wagons. Will handle oils of most any nature including heavy road oil.

Price..... **\$22.00**

Little Giant Tank Pump

This pump, while not in the same class as the Bullock Tank Pump described above, is simple and has all working parts arranged so as to be readily accessible.

The removal of four nuts expose both the suction and discharge valves for any adjustments that might be necessary. The valves are of the hinge type, simple and reliable. The water openings are ample size to eliminate friction, making this an easy working pump.

It has a 5-inch stroke and a 5-inch diameter cylinder, giving a capacity of .425 gallons per stroke—is tapped in discharge and suction for a 2-inch pipe, also arranged with unions for hose.

The design is such that the handle may be attached to either side of the pump to suit the convenience of the user. Drain plugs are provided, that the pump may be drained, a particularly good feature when used in a freezing temperature.

Little Giant Tank Pump—Cylinder 5 inches diameter by 5 inch stroke, suction and discharge both 2 inches, pipe and hose. Weight 65 pounds.

Price each..... **\$12.00**

For Suction and Discharge Hose see Rubber Section

Hand and Windmill Pumps

Fig. 61 Windmill Lift Standard

Closed Top

A good pump for medium and deep wells

Standard. Strong, but not cumbersome, well made to withstand heavy duty. Tapped just below spout for $1\frac{1}{4}$ -inch pipe; can be tapped for $1\frac{1}{2}$, 2, or $2\frac{1}{2}$ -inch if desired. Bearing for cap measures $3\frac{3}{4}$ -inch diameter and 2-inch high.

Cap. Closed top pattern equipped with swinging fulcrum. Fastens to stand with $\frac{3}{8}$ -inch by $\frac{7}{8}$ -inch set screw. Readily adjusted to any position on stand. Fitted with cap bushing to accommodate 1 by $\frac{1}{2}$ -inch windmill slide bar. Handle and fulcrum are connected by steel pins.

6-inch stroke, 67 pounds.
Price each.....\$7.50
10-inch stroke, 72 pounds.
Price each.....\$8.00

Fig. 172 Force Pump
For Hand and Windmill

A first class and reliable force pump, for deep wells and heavy duty.

Standard. Plain pattern, well proportioned. Back outlet for elevating water 1-inch; can be fitted for $1\frac{1}{4}$ or $1\frac{1}{2}$ -inch if desired. Tapped in base for $1\frac{1}{4}$ -inch pipe, but may be arranged for $1\frac{1}{2}$, 2 or $2\frac{1}{2}$ -inch pipe. Piston rod is $\frac{5}{8}$ -inch polished steel and connects to windmill bar with malleable coupling.

Stuffing box nut and thumb screw are of brass.

Cap. Extra heavy and fastens to standard with three set-screws. Handle and fulcrum attach to cap with $\frac{3}{8}$ -bolts. A bushing is fitted into upper part of cap and serves as a guide for windmill bar.

Bolted spouts in either the plain, syphon or cock style can be furnished if desired.

6-inch stroke, 66 pounds.
Price.....\$8.00
10-inch stroke, 75 pounds.
Price.....\$8.70

Fig. 172 Set Length Force Pump

For Hand or Windmill Use
Anti-Freezing—6-inch Stroke

Standard. Heavy and strong. Back outlet for elevating water for 1-inch connections. Can be fitted for $1\frac{1}{4}$ -inch. Piston rod is $\frac{5}{8}$ -inch and connects to windmill bar with malleable coupling. Stuffing box nut and thumb screw are of brass.

Cap. Extra heavy and fastens to standard with three set-screws. Handle with fulcrum attached to cap with $\frac{3}{8}$ -inch bolts. A bushing is fitted into upper part of cap and serves as a guide for windmill bar.

Bolted spouts either plain, syphon or cock style furnished if desired. Extra price.

One hose attachment and cut-off clevis are included with the pump.

No.	Size Pipe, Inches	Cylinder, All Iron, Style D, Inches	Price Each
2	$1\frac{1}{4}$	$2\frac{1}{2} \times 10$	\$11.20
4	$1\frac{1}{4}$	3×10	11.50
6	$1\frac{1}{2}$	$3\frac{1}{2} \times 10$	12.00
8	2	4×10	12.80

Cast spout regularly furnished.

Fig. 133 Double Acting Force Pump
For Deep Wells or Windmills

Lower cylinder may be from $2\frac{1}{2}$ to $3\frac{1}{2}$ -inch—not furnished unless ordered.

Standard is of lattice pattern and is cast in half sections with the cap. Plunger Rod is of $\frac{1}{2}$ -inch and connects to windmill bar with special coupling.

Air Chamber Pipe is $\frac{3}{4}$ -inch and connects with lower bridge as does also the discharge pipe of the same diameter. A goose-neck attaches to the upper end of discharge pipe and is fitted with clevis for hose attachment.

Upper Cylinder consists of a seamless drawn brass tube in which operates the differential plunger producing a steady uniform flow of water.

This pump can be equipped for shallow well by removing the lower nut and inserting 3×10 -inch cylinder into the combination cap.

Weight, 80 pounds.
 $2\frac{1}{2}$ -inch, no lower cylinder. Price each.....\$15.70
3-inch, no lower cylinder. Price each.....\$16.00
 $3\frac{1}{2}$ -inch, no lower cylinder. Price each.....\$16.70
Add for 3-way cock as shown.....4.00
Lower cylinders are extra.

No. 1413 Spray Pumps

With brass valves and ground bevel brass seats, 2-inch removable cylinder and hemp packed plunger for either hot or cold mixture.

Has valve located between air chamber and pump, which retains the pressure of the air chamber on the nozzles and relieves the valves of the pump.

Plunger is brass and hemp packed. Cylinder is a seamless drawn brass tube two inches in diameter and removable.

The special gear leverage adapts this pump particularly for spraying purposes where the work is done under heavy pressure.

Price with pressure gauge and strainer.....\$30.00

Fig. 1518

Complete Barrel Spray Outfit

Mounted on skids with 50-gallon barrel and mechanical agitator.

With Fig. 1413 pump, 50-gallon barrel on skids, with pressure gauge, two 15-foot leads of $\frac{1}{2}$ -inch 7-ply discharge hose, two spray nozzles, two 8-foot pipe extensions with lever shut-off and mechanical agitator. Price.....\$56.00

Fig. 529 Eclipse Pail Spray Pump

With jet agitators and rubber ball valves.

Made in two styles, one with foot stirrup as shown, the other with bucket or pail attachment.

All parts in contact with liquid are of brass. Acid solutions can be used for spraying fruit trees, shrubbery, flowers or vines. Weight $5\frac{1}{2}$ pounds.

Price includes three feet of $\frac{1}{4}$ -inch rubber tubing and spray nozzle. Price.....\$5.50

Spray Nozzles

Fig. 1563 Reg. Vermorel

Fig. 1559 45° Angle

Fig. 1564 Grad. Vermorel

Produce a perfect mist of fine spray at low pressures, spraying a large area with a small quantity of liquid. All for $\frac{1}{4}$ -inch iron pipe. Three styles shown, each.....\$1.20

Closed-Top Pitcher-Spout Pump

Long lever, revolving closed top, secured by set screw. Cylinder with open spout. High bolted base fitted for iron or lead pipe connection. Stroke No. 5 is 5 inches. No. 4, $4\frac{1}{2}$ inches; balance 4 inches.

Sizes and Prices

Number	Diameter Cylinder	Suction Fitted for Pipe	Weight, Lbs.	Iron, Price	Brass Lined Cylinder, Price

Fig. 85 Hand Lift Pump Standard

Suitable for outside cisterns and shallow wells. Light, substantial and inexpensive.

Standard tapped in base below spout for $1\frac{1}{4}$ -inch pipe. Tapped $1\frac{1}{2}$ or 2-inch when so ordered. Cap bearing measures $3\frac{3}{8}$ -inch diameter and $1\frac{5}{8}$ -inch high.

Cap fastens to stand with $\frac{7}{8}$ x $\frac{1}{8}$ -inch set screw and can be adjusted to any position. Pump rod attaches to handle with malleable coupling and screw. Bolt connects handle to cap. Weight 43 pounds. 6-inch stroke.

Price.....\$5.00

Fig. 85

Fig. 404 Set Length Lift Pump

Anti-Freezing

A well made pump for shallow well and cistern use.

Cap fastens to standard with set screw and can be adjusted to any desired angle.

Standard is of straight stock pattern with $1\frac{1}{4}$ -inch spout and flanged base. Brace is supplied with each pump.

Cylinder, 3x10 inches. Plunger and valve leathers are cut from best quality leather stock. Cylinder and all working parts are turned upon special machinery.

Cylinder is connected to standard by full length $1\frac{1}{4}$ -inch wrought iron pipe.

Cylinder tapped for $1\frac{1}{4}$ -inch suction pipe; can be tapped $1\frac{1}{2}$ -inch if desired. Galvanized or extra length pipe furnished, if ordered, at nominal cost.

Weight, 55 pounds. 6-inch stroke. Price.....\$6.50

Fig. 404

The Johnson Brass Well Screen

Has inlet slot cut accurately to width and extending spirally around the tube, giving largest possible intake capacity per foot of length.

In shape the slot is narrowest on the outside and by widening inwards prevents choking.

Slot widths are measured in thousandths of an inch and any width from four to thirty thousandths can be made.

The sectional cut shows the endless inlet with the sharp lip that keeps it free from sand; and the short oval holes that make the screen strong, with all widths of slot.

Standard Earth Augers

This Standard well boring outfit will dig a well 20 to 100 feet deep with equal ease. No pressure needed, simply turn the handle and it bores into the earth with its own weight. Auger can be adjusted to bore wells from 8 to 16 inches in diameter.

As soon as the length of the auger has been reached, unscrew the auger head and connect another piece of extension pipe. The couplings for this purpose are supplied with each outfit. They are of malleable iron and fastened with bolts.

When well becomes so deep it is difficult to hold the auger steady, a quadruple expansion brace is supplied. This brace pushes against the sides of the well, steadies the auger and keeps the well straight.

Bores through any formation of earth. Stones or gravel do not interfere. If a stone too large to go into the auger is struck, unscrew auger head and screw on Standard Ram's Horn which is made of tool steel and will twist around any ordinary sized rock and bring it out.

Outfit No. 1. For boring wells 40 feet deep and less. Consists of one No. 10 earth auger, two expansion blades, 40 feet connection pipe, 12 special malleable couplings with bolts, 1 Standard internal grapple. Price.....\$18.00

Outfit No. 2. For boring wells 100 feet deep and less. Consists of 1 No. 10 earth auger, 2 expansion blades, 100 feet connecting pipe, 24 special malleable couplings with bolts, 1 extension brace and stem, 1 Standard internal grapple. Price.....\$37.50

No. 5 auger boring 4 different sized holes, viz., 5, 6, 7 and 8 inches in diameter, 3½ feet deep. Price each.....\$5.25

No. 8 auger boring 7 different sized holes, viz., 8, 9, 10, 11, 12, 13 and 14 inches in diameter, 3½ feet deep. Price each.....\$5.60

No. 10 auger boring 9 different sized holes, viz., 8, 9, 10, 11, 12, 13, 14, 15 and 16 inches in diameter, 3½ feet deep. Price each.....\$6.35

No. 14 auger boring 7 different sized holes, with telescope stem for boring holes 8 feet deep. Price each.....\$10.00

No. 16 auger boring 9 different sized holes, with telescope stem for boring holes 8 feet deep. Price each.....\$10.00

Any of our augers can be extended for deeper or shallow well boring by simply coupling on extra pipe.

Pump Jacks

No. 0

No. 3

No. 4

No. 5

For operating pump standards by power that are now operated by hand or used in connection with windmills. Pitmans are adjustable to any height of pump standard. Foot rest for bolting securely to platform serves also as brace for pump stand. Swivel pump connection admits of setting jack at almost any angle to pump standard and affords quick connection from power to hand and back again without the use of bolts. When a pump is set directly under a windmill it can be operated in three different ways—by hand, by windmill or by gasoline power.

Size No.	Description	Suitable for Gasoline Engine	Back Geared	Strokes, Inches	T. & L. Pulleys, Ins.	Wgt., Lbs.	Price Each

	Air attachment for No. 5.					22	11.00

Motor Drive Pump Jack

For motor drive on windmill pump for deep well work.

It is made extra wide, measuring 13 inches between the gear wheels, which adapts it for use with 3-way pumps.

Shaft 1½ inches. Pulley 24x2½ inches. Back gears reduce the speed of 1750 R. P. M. motor to 35 strokes of pump.

Price of jack, without motor or pump, as shown in cut.....\$15.00

Pump Jack
For Diaphragm Pumps

It consists of a strong box-type frame carrying two shafts with gear and pinion. Large babbit bearings with grease cup lubrications.

Extended end of shaft fitted with 12x3-inch pulley for belt drive sprocket for chain drive. With machine cut auxiliary gear and pinion for direct connections, if desired.

Stroke, Inches	Geared	Approx. Weight, Pounds	Floor Dimen., Inches	Fitted With	Price
4, 6, 8 & 10	5 to 1	78	7¼x10¼	Pulley	\$15.00
4, 6, 8 & 10	10 to 0	73	7¼x10¼	Engine Gearing	21.25

Jack Connected to Pump and Motor

The Allrite Pumping Head

The Allrite pumping head will handle a 4-inch cylinder 70 feet or less in the well, or a 2½-inch cylinder 170 feet in the well. Places between these points should have a suitable size cylinder.

To the base plate of the frame is attached the pipe head, which is tapped for pipe to well cylinder and delivery pipe. Smaller well pipe can be used by bushing the head. The delivery pipe should have a swing check valve near head to hold water up. When not used to the limit, the pumping head will also elevate to a moderate height. The pipe head is made in two parts to allow top piece to be taken off to remove the plunger when full sized pipe is used on shallow wells.

Dimensions

Stroke 12 inches—Geared 6 to 1.

Pulley 18 inches for 4-inch belt.

Pipe head tapped for 4-inch pipe with 2-inch discharge.

Floor space 22x23 inches, height 30 inches, weight 400 pounds.

Price, \$77.00

The "Colco" Pump

Non-Corrosive—Large Capacity—Easily Accessible—Perfectly Sanitary

Designed and built for the special purpose of pumping all kinds of corrosive fluids which require all bronze construction.

For use in chemical works, canning and bottling plants, breweries, distilleries, etc.

The cylinder, valve and all internal working parts coming in contact with the fluid are made regularly of bronze, or can be made of any special alloy. All parts are machined and smoothly finished.

It is easy to take apart and put together for cleaning after each run if desired.

No wrenches or tools are required to disassemble it, and no packing is destroyed in doing so. By loosening lock screw at top, yoke can be swung out. Top cap lifts off, exposing the discharge valve which is in the piston. Cylinder lifts off, exposing all of the piston and the suction valve. All these parts are easily removed.

Its design is mechanical, and the material and workmanship in its construction are high class in every detail.

It is furnished with tight and loose pulleys and the upper part of pump can be turned so that connections can be made from either side.

It is practically noiseless in operation. The suction and discharge valves are air cushioned, and there is no friction to injure the fluids.

A by-pass with valve is between the suction and discharge for regulating the capacity if maximum is not needed. It can be regulated while the pump is running.

The two joints between suction box and cylinder, and between the cylinder and cap, are metal and are further sealed with a round rubber ring which is merely compressed in a square groove.

The piston is non-packed, having the groove rings. No packing comes in direct contact with the liquid.

The connections of the pump are regularly standard pipe thread, but can be furnished with sanitary unions if desired.

Its capacity is very large for its size. It occupies very little floor space and requires little power for operation. It has passed the most rigid inspection of many sanitary boards.

Always state the nature of the liquids to be pumped with their consistency and whether hot or cold. This pump can be made of other alloys to suit liquids if bronze is not suited.

Style A
For double acting cylinders
with all steel displacement
plunger.

Deep Well Power Pump Heads

Double geared with balance wheel. Machine cut gears for operating single or double acting water cylinders.

Two Styles:

Style "B" for single acting cylinders.

Style "A" for double acting cylinders.

When used with single acting cylinders the heads are equipped with a brass differential displacement plunger.

These heads are extremely heavy in design to meet the requirements of heavy lifts on deep wells or large volumes of water. Bearings are extra large and the heavy balance wheel gives continuous steady motion.

Illustration at right shows details of Style B head ready for operation—single acting cylinder.

This type of well is bored and cased as shown. The well piping extends down through all surface formations and is driven firmly into the underlying rock stratum, excluding possibility of contamination from surface seepage. The water is usually derived from a sand or gravel stratum, with a rock capping seal above, forming a filtration plant science has never equaled. When there is a tendency of the sand or gravel in the water bearing stratum to cave or pump out, a screen of suitable length and diameter is placed below the water cylinder to exclude it.

The brass working barrel of a single acting deep well pump placed in pumping position in the well is shown. It is placed at the lowest pumping water level in the well, preferably equipped with 35 feet of suction pipe below, to prevent the possible intake of air. It is connected by a wrought iron pipe, of a larger diameter than the bore of the cylinder, to the base of the pump head, to permit drawing out of the plunger and valves through the pipe. The plunger is connected with the reciprocating mechanism at the surface by wood or metal rods, having screw threaded joints.

No. 31½ has outboard bearings on pulley shaft.

For extreme loads increase pulley diameter 15 per cent, at extra cost.

Pipe connections can be bushed smaller if desired.

Junior Belted Deep Well Pump Head

Single Geared—With Cut Gear and Pinion

Can be used with either single or double acting water cylinders.

May be belted to any source of power. The head is placed directly over the well on a brick, stone, concrete or timber foundation and is so constructed that the entire frame can be slid backward on the bed plate when one desires to remove plunger from the well to repack cylinders, etc.

The plunger rod is made of forged steel. The discharge pipe, which sustains the water cylinder in the well, is screwed into a tee, placed at the base of the pumphead and is held in place by the weight of this pipe and by bolts in the foundation.

No.	Stroke in Inches	Proportion of Gearing	Total Lifts According Diam. of Cylinder, Feet	Pipe Connection or Smaller		Floor Space and Height, Inches	Pulleys		Speed, Rev. per Min.	Horse Power, Extreme Load	Approx. Weight, Lbs.	Price

Motor Driven Unit Well Heads quoted upon request.

For cylinders and other accessories, see index.

Steam Driven Deep Well Pump Head

Used with Single Acting Deep Well Cylinders

This engine has a brass differential displacement plunger, made on a forged steel plunger rod, by means of which a part of the water is discharged on the down stroke, permitting, in many cases where water is forced to a considerable distance above ground directly into stand pipe or pressure main, the use of a smaller steam head and removing part of the load from pump rods and valves in the well.

Steam is admitted by a single balanced ground valve, operated by a special auxiliary finger turned valve stem, the simplest valve construction employed in any steam pump. Since valve is balanced but little steam is required to operate it.

Also made with an all-steel plunger for operating double acting cylinders at the same price.

No.	Steam Cyl.		Water Pipes*		Diam. Brass Diff. Plunger, Ins.	Steam Pipes		W. R. Cyls. Takes	Approx. Weight, Lbs.	Price

13	14	36	8	6	4	2½	3	1½	2600	670.00

*If smaller wanted—bush openings. Nos. 12 and 13 made for 10 and 7-inch if so ordered. Special heavy duty heads in larger sizes upon request.

Junior Steam Driven Deep Well Pump Head

For use in small factories, creameries, cotton gins, etc.

This pumping head is used in connection with working barrels or set length water cylinders for pumping drilled or open wells.

The remarkably simple design of this engine has made it a leader, many thousands of them are now in use.

The long stroke sizes are recommended. They not only pump more water per minute with the same diameter of cylinder, but the water valves last longer.

To make a complete plant there is required besides the head, pumping rods, water pipe, working barrel, and, if water is to be forced a considerable distance, an air chamber and discharge check valve. Where the steam pressure varies excessively a pressure reducing valve can be used to good advantage.

No.	Steam Cyl.		Floor Space, Ft. Sq.	Hght., Ft.	Steam and Water Pipes				Approx. Wght., Lbs.	Price

19	5	16	1½	5	¾	1	4	3	350	108.00

Suction may be bushed to connect to smaller pipe and discharge also reduced proportionately.

Marsh Steam Driven Deep Well Pump Head

With Plain Yoke Base

For deep or shallow wells. Can be attached to any plunger rod.

A simple, moderately priced head. Has regulating valves for equalizing the motion of the rod when used with single acting cylinders, where the work is all on the up-stroke and the weight of the heavy rod might otherwise cause the piston to drop too suddenly.

No.	Steam Cyl.		Steam and Water Pipes				Well Rod, Inches	Floor Space, Inches	Approx. Weight, Pounds	Price

For Well Head Accessories, see Index.

"American" All Brass, Double Acting, Double Quantity, Removable Valve, Water Cylinder

Can be repacked without removal of cylinder shell from well.
Overcomes friction loss in forcing the water up a smaller main pipe.
About same power required by single acting pump—
but double the quantity of water.

The advantage of this cylinder over others is in the plunger rod—all the valves are mounted on this rod and are drawn from the well with it at a single operation—it is easily repaired and saves the expense of drawing the pump pipe out of well.

The illustration at the right shows all parts in position when being removed for repairs—B shows top brass ball, seated within a steel cage—C is a section of the brass piston tube—D shows removable brass check valve—E shows plunger with four cup shaped leather packings—F is a section of bottom brass piston tube—G is bottom brass check valve which seats at bottom of cylinder—H shows portion of check lifter, which raises the lower check valve from its seat when valves are being removed for repairs.

The Valves are of smaller diameter than the inside diameter of the column or discharge pipe.

Discharges the full capacity of the cylinder on the down stroke as well as on the up stroke—therefore, it is not only double-acting—but actually gives double quantity of water.

Will pump twice as much water as any single acting cylinder of the same displacement—when run at the same speed.

The flow is constant—therefore, there is less vibration or water-hammer and the plunger rod is not subjected to as heavy strains, consequently can be operated at much higher speed.

The cylinder I and plunger rods G and H are of X heavy seamless drawn brass tubing. All other metal parts are of cast brass, including top and bottom couplings into which suction and discharge pipes are screwed. The valves S1 and S2 and D1 are extra heavy and of best quality rubber. The ball valve D2 is of brass, the cage is of steel. The plunger J is packed with cup leathers as at L, the hollow rods G and H where they travel through the valve seats are packed with special flanged leather as at K and K1; this prevents leakage of water around the rods and is very essential.

Operation

On the up stroke, valve S1 opens and space A below the plunger is filled, at same time the discharge valve D1 opens and water in space E above the plunger is forced up into discharge pipe F.

On the down stroke, valves S1 and D1 close and valve S2 opens and water is drawn through hollow rod H (indicated by arrow C) and fills space E. At same time the ball discharge valve D2 opens and the water in space A below the plunger is forced up through the hollow rod C (indicated by arrow M1 and M2) into the discharge pipe F.

It may be used with our belt driven or our steam pump heads.

If water is obtained in caving materials, have well completed with screen before putting in pump.

No.	Inside Diam. Cylinder, Inches	Maximum Stroke, Inches	Theoretical Capacity When Plunger Travels 100 Up Feet per Minute		Pipe Thread at Top, Inches	Pipe Thread at Bottom, Inches	Smallest Diameter of Well Cylinder Will Go In, Inches	Approx. Weight, Pounds	Price Each

52	11 1/4	36	911	54700	12	10	15	950	1550.00

Can furnish flush cap type at same price—in this type the inside diameter of the cylinder is larger than the inside diameter of discharge pipe or column, also the pipe connections and size of well is considerably smaller.

All Brass Artesian Well Cylinder

Fig. 448

With Bronze Ball Valves

For heavy work and deepest wells.
This cylinder may be placed in open wells and in drilled wells where the pipe or casing is large enough to admit the cylinder attachments. For best results the cylinder should be placed in the well at a point where it will be submerged. A strainer may be connected to the bottom coupling. Standard pipe threads used in both couplings.

Shell is made of heavy seamless brass tubing. Valves are extra heavy and fitted with four perfect cup leathers and bronze balls.

The plunger and lower valves can be removed through the connecting pipe, which is larger in diameter than the bore of the cylinder—convenient when repairs are necessary.

Wood sucker rods with forged couplings are recommended.

Intermediate sizes take place of next larger size.

All Brass Eureka Tubular Well Cylinder

Fig. 450. Usually recommended when locating cylinder above screen point

Made of seamless drawn brass tubing and filled with poppet plunger and check valves. It is set in place, after the well is made, by means of seating tool attached to drill rod.

The seating tool revolves the cylinder proper and screws it down to the spring dog coupling, which holds firmly to the inside walls of the pipe or well casing. The rubber packing between cylinder and coupling is thus forced out against the pipe, making a firm tight joint.

Price includes valves and spring dog coupling.

Flush or tubular well points, extensions or points with other gauge or perforations, upon request. Be sure to state mesh of gauge desired.

Pump Cylinders or Working Barrels

In the cylinders listed below, Styles "D" and "C" are iron body—Style "D" has iron plunger, yoke and valve—Style "C" has iron plunger, brass yoke and valve. Styles A, B and E are brass body and brass lined types—Style A has iron caps and nuts, iron plunger, brass yoke and valve—Style B has iron caps and nuts, brass plunger, yoke and valve. Style E is all brass with two leather plungers.

In the cylinder plungers Fig. 1 shows plunger furnished in Style B cylinders. It has brass yoke, poppet and follower, one leather and galvanized iron stub. Fig. 2—furnished in all Style A, C and D cylinders—10-inch size only. Design A has brass yoke and poppet, iron follower, one leather and galvanized iron stub. Design D is constructed entirely of iron with one leather and galvanized iron stub. Fig. 3—furnished in all Style A, C and D cylinders—12 and 14-inch sizes—construction same as designated in Fig. 2.

Fig. 4. Same as Fig. 3, furnished in Style A, C and D cylinders in sizes 16, 18 and 20 inches.

Fig. 5. Design B plunger complete, same as Fig. 2 and has two leathers.

Fig. 6. Design A, C and B plunger, same as Fig. 2 and has two leathers.

Fig. 7. Design B plunger, has brass yoke, follower and ball valve, two leathers and galvanized iron stub. Can be furnished in any type of cylinder.

The 1 1/4-inch cylinders furnished flush only. Cylinders 2 to 3 1/4-inch diameter are regularly tapped at the top and bottom for 1 1/4-inch pipe, the 3 1/2-inch for 1 1/2-inch pipe and 4-inch and over for 2-inch pipe. 1 1/4-inch all brass cylinder tapped only for 1-inch pipe. All cylinder stubs fitted for 3/4-inch couplings, but may be fitted for 1/2-inch if desired.

Unless specified iron cylinder, except 10-inch, will be sent Style C—brass lined and brass body cylinder. Style A cylinders are regularly equipped with outside caps and nuts. Flush caps and nuts are extra.

The "Rife" Hydraulic Ram

Patented-Automatic

For the Supply of Water to Villages, Estates, Farm Houses, Cottages, Railroad Tanks and for Irrigating Purposes.

The hydraulic ram is a self-acting pump which utilizes the momentum of a fall of water to force a part of the water to an elevation many times as high as the fall used to operate the ram.

The simplicity and durability of this machine makes it useful and economical for forcing water to distant and elevated points.

A slight fall only is required to operate the ram, but as the amount of fall is increased, its operation becomes more powerful, and will force water in a proportionately larger flow or to a higher elevation.

The amount of water delivered or the proportion of the water raised to the amount wasted in operating the ram, varies with the amount of fall and height to which it is elevated.

An increase in the fall or decrease in the head will cause a corresponding increase in the amount of water delivered by the ram.

Rams are frequently used for forcing water 100 to 200 rods and to elevations of 100 to 150 feet.

Water can be used direct from the ram or from a storage tank which is kept filled by the ram.

The Rife ram will force water to an elevation of 20 to 30 feet for every foot of fall obtained in the flow of stream. The wearing parts are of unusual durability, simple, few in number and easily replaced.

The Double Acting Ram is used where combined flow of spring and creek is necessary for water supply.

Showing Sizes 10 to 40.

Method of Operation.—See sectional view. Escape valve "C" is open permitting flow down the drive pipe to increase in velocity until lifting force of escaping water is sufficient to raise and close this valve, cutting off flow. As drive pipe "A" is quite long, holding a large quantity of rapidly flowing water, this water when suddenly stopped forces a small portion of the water into air chamber "E" through delivery valve "D." As soon as pressure in air chamber "E" becomes equal to the pressure suddenly created in drive pipe "A," the valve "D" closes again, thus trapping the water which has entered "E." This water, in entering, has caused the air to become compressed in air chamber "E" and this is what forces the water into delivery pipe "F."

Valve "C" remains up against its seat as long as the high pressure exists in the drive pipe "A," but as this pipe is open at the intake end, the extreme pressure cannot exist there more than a fraction of a second during which time the water in the drive pipe "A" has rebounded, which causes a partial vacuum under the escape valve "C," allowing it to drop back to its original position. At this point the cycle of operation is again started. The air feeder "H" admits a small quantity of air during each cycle, which supplies the necessary compressed air for the air chamber, also for pneumatic system when used.

Information necessary. Flow of water in gallons per minute. Fall in feet. Distance in which fall is obtained. Height above ram water is to be raised. Distance water is to be delivered. How many gallons per day are required. If double acting ram, state flow, in gallons, of spring water per minute and fall from spring to ram.

Method of locating. Locate ram the proper distance from spring or water supply and connect as shown at "A." Conduct water to an intermediate reservoir or standpipe located at proper distance from ram and connect as shown at "B." Sink the ram in pit to necessary depth and lay drain pipe as at "C."

Three feet is the least number of feet of fall recommended.

No.	Price		Weight Lbs.	Gallons per Min. Required to Operate Ram	Piping Drive Pipe Delivery Pipe	Dimensions in inches

To arrive at amount of water delivered—multiply the gallons per minute available for supplying ram by the number of feet of fall. Multiply this amount by 40, then divide by height in feet the water is to be delivered. Multiply this amount by 24 gives the capacity in gallons for 24 hours.

No. 386 Gasoline Garage Pump

For elevating gasoline, kerosene and oils of similar nature from an underground tank or reservoir and delivering to receptacle at any point within a radius of 50 feet from the pump. Suitable hose can be attached to spout for delivering oil to auto.

Working head or cylinder consists of a seamless brass tube, to which is fitted an iron cap and base. The cap is in one piece and chambered for a fibre gasket—making a tight joint. The base is connected to cylinder in the same manner. Four bolts connect the cap and base, holding all parts firmly in place. The gland stuffing-box nut used prevents all leakage around the piston. This head, including sub-base, is mounted on an iron pipe pedestal 25 inches high. Height of pump is 34 inches from base to discharge and 43 inches to highest point.

Plunger is brass; no leather or packing of any kind is used. Three brass rings fit into the follower and are held in position by a yoke which screws into follower. An original feature of this pump is the all brass trip valve, located in the sub-base. This valve is ground on to a brass seat and operated by a nickel plated button and stem. When operating the pump this valve must be closed and the stem pulled out. When through pumping, to drain, open valve by pushing in the button. Pump is provided with a device for locking the lever to prevent tampering. Position of discharge is adjustable.

Direct Action Gasoline Garage Pump

This is another style of hand operated gasoline pump. Like the No. 386 it is constructed to comply with the specifications and requirements of the national board of fire underwriters. It has been approved and bears the label of inspection attached to cylinder. It occupies very little space, works easily and has a large pumping capacity.

The handle can be locked down to prevent tampering and it is provided with a safety cock on which a pail may be hung or to which a hose may be attached to carry the gasoline to an automobile or power boat tank.

No. 391. Power Rotary Force Pump for Gasoline

Approved by National Board of Underwriters

These pumps are designed for economical and absolutely safe handling of gasoline and other oils of a similar combustible nature.

Adopted by manufacturers of dry cleaning systems for installation in connection with their equipment and by users of gasoline generally, as a sure precaution against explosions and fire and to comply with the requirements of fire insurance companies, city ordinances and state laws. Can be connected to draw from two or more tanks containing different liquids.

These pumps have Tobin bronze shafts, brass check and relief valves, copper depolarizer, brass oil cups, bronze cams, brass valve and galvanized malleable fittings.

The bronze cams are milled to gauge and adjusted to fit the accurately bored case with just enough clearance to secure the maximum efficiency.

We furnish Piping enough to place Tank about 20 feet away from Pump

How to Place Tank

To comply with the insurance regulations in most states, the tank should be buried far enough underground so that at least two feet of earth will cover it. The use of cinders or ashes around the tank should be scrupulously avoided, as they start a chemical action that will corrode and rust through any exposed metal. Black earth, clay, or gravel will give no trouble in this respect.

The pumps furnished are specially designed for this class of work. The cylinder is heavy seamless brass tubing and all valves, piston and piston-rod are brass. The valves are accurately ground to their seats. A suitable stand is furnished, placing the pump within easy reach. The suction pipe may be taken from either the bottom or side of bottom flange. A lock and key is furnished to protect the gasoline supply. By substituting self-measuring pump any outfit can be converted from a non-measuring to a high grade measuring system.

Prices below include welded or riveted tank as desired, pump, filler pipe complete with dust-proof cap, two locks and keys, filler tube with screen, suction tube, pipe and fittings as shown cut and fitted, ready to install. Gasoline hose is extra.

Gasoline Underground Storage Outfits

For Garages and Supply Depots

Comply with all Insurance and State Laws
Covering Storage of Gasoline

These outfits are designed to meet the growing demand for a high grade storage system—they are built right—entirely removing all danger of explosion, fire, theft, loss by evaporation or leakage—they are dependable in every respect.

Side Walk Pump

Each outfit consists of pump with tank of capacity and gauge stated. The tank has a suction line extending to the bottom, which is fitted with an all-brass wire screen foot valve, and an all-brass check valve. A 2-inch double construction fill-pipe with fine wire screen filter and lock cap is also furnished with each tank. 1½-inch galvanized pipe is used for connecting the pump to the suction line in the tank. This is not furnished.

Garage Pump

Motor Driven Positive Force Rotary Pumps

For Gasoline Filling Stations

A very efficient and compact unit. Size 22x12x60 inches high. Suitable for curb or inside use.

It has a ¾ H. P. electric motor direct connected to a ¾-inch pump, which delivers 10 gallons per minute.

It has a 10-gallon meter which also shows quarts on dial, obviating the risk of short or overmeasure.

The meter is thoroughly tested and accurate.

Ten feet of gasoline hose furnished with each outfit.

Gross weight about 125 pounds. Painted a good red.

Persons wanting a first class power driven pump will make no mistake in ordering this outfit.

Price.....\$333.00

Pump with Cover
RemovedPump with Cover
for Curb Use

The Doran Gasoline Filling Station Pumps

The Doran self-measuring gasoline pump is without question the best on the market.

All pumping motion is forward, there being no reverse motion. Five revolutions of the crank give a complete up-and-down pump stroke and one gallon of liquid. Ten revolutions give two gallons.

The action is continuous, in fact no other pump equals it in pumping efficiency or in ease of operation.

Furnished either with or without storage tanks.

Curb Pump

The Curb pump has the same equipment as below together with an 8-foot length of armored gasoline hose, fitted with a new model, long fill-pipe nozzle with a fine mesh wire screen filter.

Price.....\$171.50

Electric fixture wired for connection with a 10-inch ruby globe. Price extra..\$15.00

Garage Pump

The Garage pump has a 10-gallon register which may be set back to "0" from any point. A 1½-inch suction line is used, and a brass to iron ground seat union and an all-brass check foot valve is furnished with every pump.

Price.....\$77.50

Domestic Water Supply Systems

A complete pneumatic water supply system, with hot and cold water, such as is usually installed in a country or suburban home. It consists of a double-acting horizontal hand force pump with special air attachment. This pump may be replaced by any suitable power pump, driven by gas, gasoline, steam or hot air engine, electric motor or windmill, and, in fact, where a large tank is used and a large amount of water is required we recommend some other method of pumping. A vertical instead of a horizontal tank may be used. Sometimes it is more convenient to bury it below the frost line in the ground outside.

The home is furnished with a water supply at low cost. The inexpensive fittings and fixtures now furnished enable a man of moderate means to provide modern conveniences and reduce the drudgery of housework to a minimum.

The application of compressed air to the moving of liquids is not new. It has been used in various forms for a great many years, but the successful application has been brought about only in the past few years and after a great deal of experimental work. The experimental stage is now past and the pneumatic water system is a pronounced success. Thousands of such systems are now in operation. Their reliability is attested by the fact that many large public buildings depend upon this system alone for their water supply.

Operation

The operation of the pneumatic water works system is exceedingly simple. The essential apparatus consists merely of a pump, an air-tight tank and the necessary pipes for the transmission of water. The pump and the tank must of a necessity be designed for their work. If water be pumped into an air-tight tank, it occupies part of the space originally occupied by air. There is no escape for the air, and it is therefore crowded or compressed into a smaller space. Additional pumping will further compress the air until the limit of the apparatus is attained. If a valve at the bottom of the tank is now opened, the water will be forced out by the expansion of the air. Under these conditions, the entire amount of water will be forced out of the tank.

A house equipped with the pneumatic system has perfect fire protection. In large cities the water pressure is usually less than 50 pounds. This pressure is easily available with the pneumatic system and it is equivalent to that given by a tank elevated to a height of one hundred and fifteen feet.

The following pages contain descriptions and prices of a few popular sizes and types of pneumatic pumpers, enamel ware, etc. Write for full information and catalog on special outfits.

Fig. 300

Gasoline Engine Driven Self Contained Pumping Unit With Pneumatic Tank Connected

With All Fittings Necessary for a Complete Water System

This pumping unit consists of a $1\frac{1}{2}$ horse power gasoline driven, direct connected pump for use where the vertical suction distance does not exceed 20 feet. It has the fuel reservoir cast in the base, doing away with all danger from leaking gasoline. The ignition is furnished by a water-proof magneto, built on and directly connected to the engine, making necessary the use of only one wire to connect with the spark mechanism on the cylinder.

The gearing driving the pump may be instantly detached by a simple movement of a lever handle. By disengaging the gearing, the gasoline motor is available for other power work, it being regularly equipped with a 5x8-inch pulley, allowing economical operation of numerous labor saving devices such as washing machines, cream separators, etc.

All bearings are jig babbitted and all gears are machine cut minimizing the noise usually incident to gear driven units.

The pump proper on the unit is brass lined with brass valve seats, the valve poppets are one piece, leather faced and have extra long guides to insure proper seating. The pump piston rod is one piece solid bronze turned and polished.

It can be used with any sized pneumatic or open tank.

Fig. 300 gasoline pump has a capacity of 450 gallons per hour. It has magneto ignition and air intake valve. The engine is instantly detachable for power work. Automatic circuit breaker for stopping engine.

All valves, gauges, wood supports, pipe and fittings as shown above including foot valve, are cut and fitted, ready to install.

Fig. 300

Prices of Standard Pumper and Most Popular Sizes of Pneumatic Tanks with Necessary Fittings

Fig. 300 Standard pumper only, fitted with magneto and air intake valve.....	\$150.00
If air compressor is wanted on pump in place of intake air valve, add to price.....	5.00
If complete dry battery ignition is wanted in place of magneto, deduct from price.....	7.00
If both battery and magneto ignition are wanted, add.....	10.00
Fig. 300 equipment complete, with 24-inch by 6-foot tank. Total capacity 140 gallons, working capacity 95 gallons. Weight 955 pounds. Price.....	\$250.00
Complete with 30-inch by 6-foot tank. Total capacity 220 gallons, working capacity 145 gallons. Weight 1085 pounds. Price.....	\$265.00
Complete with 30-inch by 8-foot horizontal tank. Total capacity 295 gallons, working capacity 195 gallons. Weight 1305 pounds. Price.....	\$280.00

The Pumper consists of a $1\frac{1}{2}$ H. P., direct connected gasoline pumping unit, as shown.

The gasoline motor is equipped with a speed changing lever acting directly on the governor, which allows the speed of the motor to be changed instantly while operating. This permits the capacity to be increased or decreased as desired.

If equipped for operation on natural or artificial gas, instead of gasoline, add \$12.50 to above prices, or for operating on both gas and gasoline add \$25.00.

Standard Pumper for Fig. 300 unit

Fig. 6

Automatic Self Contained Electric Pumping Unit

Connected with pneumatic tank and all fittings necessary to make a complete water system.

This electric pumping unit is for use only where vertical suction distance is not more than 20 feet.

The pump is a fine piece of workmanship, with brass lined cylinder. All working parts enclosed in a dust-proof case and running constantly in an oil bath, which feature, together with a flexible flat belt drive, insures the maximum power being transmitted to the pump piston and permits the use of a medium speed motor.

The water cylinder is fitted with an air intake valve for supplying air to a pressure system.

The pump, motor and controller, are all mounted on a cast iron base, making a very compact rig.

This unit is built in two sizes, 180 and 360 gallons capacity per hour. The 180-gallon size is arranged with motor for two pressures, 35 pounds and 50 pounds maximum, the 35-pound pump being recommended for open tank work. The pump of 360 gallons capacity is equipped with motor for one pressure only—50 pounds maximum.

In ordering be sure to state voltage, whether current is direct or alternating, whether one, two or three phase and what cycle, also type and number of pump.

Price List Pumper Only

Pump No.	Capacity per Hour Gallons	Pipe Connections		Total Head in Feet	Maximum Pressure Pounds	Shipping Weights Pounds	List Prices

These pumping units can be used with any size of pneumatic or open tank. We list below the popular sizes or pneumatic tanks complete with fittings.

Specifications and Prices Complete Units

WITH No. 1 Electric pumper, capacity 180 gallons per hour against maximum pressure of 50 pounds, complete with motor for A. C. S. P. 60 cycle 110 or 220 volt current.

Automatic pressure controller set to cut in at 30 pounds minimum and out at 50 pounds maximum.

All valves, gauges, motor, controller, pipe and fittings as shown above, cut and fitted ready to install.

Complete with 24-inch by 5-foot tank. Total capacity 120 gallons, working capacity 80 gallons. Weight 580 pounds. Price.....\$193.00

Complete with 24-inch by 6-foot tank. Total capacity 140 gallons, working capacity 95 gallons. Weight 630 pounds. Price.....\$196.00

Complete with 30-inch by 6-foot tank. Total capacity 220 gallons, working capacity 145 gallons. Weight 760 pounds. Price.....\$205.00

WITH No. 3 Electric pumper, capacity 360 gallons per hour against maximum pressure of 50 pounds, complete with motor A. C. S. P. 60 cycle 110 or 220 volt current.

Automatic pressure controller set to cut in at 30 pounds minimum and out at 50 pounds maximum.

All valves, gauges, motor, controller, wood supports, pipe and fittings as shown above, cut and fitted ready to install.

Complete with 30-inch by 6-foot tank. Total capacity 220 gallons, working capacity 145 gallons. Weight 860 pounds. Price.....\$264.00

Complete with 30-inch by 8-foot tank. Total capacity 295 gallons, working capacity 195 gallons. Weight 1000 pounds. Price.....\$266.00

Complete with 30-inch by 10-foot tank. Total capacity 365 gallons, working capacity 240 gallons. Weight 1130 pounds. Price.....\$274.00

Complete with 36-inch by 10-foot tank. Total capacity 525 gallons, working capacity 350 gallons. Weight 1365 pounds. Price.....\$295.00

Power Pumps Especially Designed for Pneumatic Outfits

Fig. 5. Oil Cased Deep Well Heads

Simplicity in the design of this pump has been so thoroughly worked out as to develop a principle of operation altogether new.

A pinion and gear with crank-pin operating in a slotted lever, bell crank type, constitutes the complete transmission, insuring positive lubrication and reducing noise and wear and tear to the minimum.

When a cylinder $2\frac{1}{2}$ inches or larger is used, a $1\frac{3}{4}$ -inch differential plunger is furnished. The differential plunger which is used only in connection with a single acting cylinder, allows for a discharge of a part of the water on the down stroke, producing an even flow and reducing strains on pump rod and connections. When a cylinder smaller than $2\frac{1}{2}$ inches is installed, the regular $\frac{5}{8}$ -inch plunger rod will be furnished, unless otherwise specified.

A belt tightener insures maximum belt contact and the load can be relieved while starting by simply lifting the idler pulley until engine is running at proper speed.

The air compressor plunger is operated directly from the bell crank and is connected to the discharge head, into which the air is directly forced. The supply to air compressor can be controlled by air cock on inlet.

The channel steel base as regularly furnished is for pump alone, and is 2 feet 4 inches long, but if electric or gasoline power is to be used, we will furnish channels four feet long for bases at no additional cost. If power is wanted, we can furnish either gasoline or electric motor.

6-inch stroke, 17x48-inch space, weight 370 pounds. Price \$ 80.00

10-inch stroke, 20x60-inch space, weight 585 pounds. Price 145.00

Specify in your order whether long or short base is wanted.

Size of pump pulley must always be specified in ordering, otherwise 12-inch pulley suitable for engine or line shaft drive will be furnished.

Discharge head is regularly tapped for 4-inch drop pipe and 1 $\frac{1}{4}$ -inch discharge. Bushings of sizes mentioned above will be furnished as ordered.

Bulldozer Power Pump With Air Compressor for Pneumatic Water Works Service

Self Contained Ready for Operation

Specifications

The **Cylinder** is formed by the main body of the pump and is bored and lined with a heavy seamless drawn brass tubing 3 inches in diameter with 5-inch stroke.

The **Gears** are double, with $1\frac{1}{4}$ -inch face, and back geared 5 to 1. All gears are cut.

The **Valves** are of the poppet pattern, and placed immediately underneath separate caps, any one of which can be removed without disturbing the others. They are all located on top of the pump.

The **Piston Rod** is brass covered, and driven from both sides, which insures perfect alignment.

The **Guide for Piston** is composed of two heavy steel rods, mounted directly on the head of the pump, insuring perfect alignment.

The **Pulleys** are 14x2 $\frac{1}{2}$ -inch face, tight and loose.

The **Air Compressor** is a seamless brass body cylinder, mounted directly on the yoke guide of the pump, the piston rod of the pump serving as a piston for the air compressor.

Capacity 400 gallons per hour.	Size of water cylinder 2	x5 inches, of air cylinder 1 $\frac{1}{4}$ x5 inches.	Price	\$65.00
Capacity 650 gallons per hour.	Size of water cylinder 2 $\frac{1}{2}$ x5 inches, of air cylinder 2	x5 inches.	Price	72.00
Capacity 900 gallons per hour.	Size of water cylinder 3	x5 inches, of air cylinder 2	x5 inches.	80.00

Oil Cased Suction Pump

Can be operated by gas engine, as shown, electric motor, line shaft, or any other available power. Gears enclosed in oil tight case, reducing wear and noise to the minimum and eliminating danger from exposed gears.

Designed primarily for pressure water system pumping, but adapted for various forms of pumping where compactness, rigidity and durability are essential and pressure desirable.

Price on any kind of power direct connected to pump on application.

Diam. of Pump Cylinder, Inches	Stroke, Inches	Diam. of Suction	Diam. of Discharge	Nominal Capacity Gallons per Hour	Price Pump Only For Belt Drive
3	5	1 $\frac{1}{4}$	1 $\frac{1}{4}$	700	\$105.00
4	5	2 $\frac{1}{2}$	2	1200	126.00
5	5	2 $\frac{1}{2}$	2	2000	148.00

Electric House Pump

For Use with Open or Pneumatic Tank Outfits or Shallow Wells

Capacity 60 gallons per hour

Specifications

The **Plunger** is all brass, $1\frac{1}{4}$ -inch in diameter, hemp packed.

The **Stroke**, 2-inch.

Suction and Discharge, $\frac{1}{4}$ -inch.

The **Valves** are brass, leather faced—brass seats.

Belt Pulley, 20x1 $\frac{1}{2}$ inches.

The **Stand** is fitted with a hardwood board, to which the motor is attached.

The **Speed**, from 100 to 135 revolutions per minute.

The **Air Cylinder** is cast brass neatly bored and polished.

The air is controlled by moving the lever "A" into a vertical or horizontal position. When set in a horizontal position it pumps air into the tank through the water line. When set in a vertical position the air is discontinued.

Floor Space, 16x20 inches. Motor $\frac{1}{4}$ H. P., driven from electric light wire.

An Ideal Booster pump for city water line where pressure is light.

For Pressure Tank Systems

Electric house pump with air compressor and $\frac{1}{4}$ H. P., A. C., 60 cycle, single phase, 110 volt motor, with belt. List

Electric house pump with air compressor and $\frac{1}{4}$ H. P., A. C., 60 cycle, single phase, 110 volt motor and automatic electric switch and belt. List

For the above pumps fitted with 110 volt D. C. motor, deduct from the above list prices, \$5.00.

For open tank service deduct from list, \$8.00.

Prices on application for outfits with motors for any current not mentioned above.

Hydro-Pneumatic Cylinder

Fig. 1445

To be used in connection with any force pump head for forcing air into pneumatic pressure tanks through regular discharge pipe. An ordinary water cylinder is used with this pneumatic cylinder, but is not a part of it.

This cylinder has a capacity of about one-third more area than the water cylinder located below it. This one-third of the capacity of the pneumatic cylinder not being supplied by the water cylinder supplies itself with air taken through the air pipe. When the pump is not required to pump air, it can be shut off by means of a lever extending to the base. When the air is shut off this extra area of the pneumatic cylinder would form a vacuum. To provide against this a by-pass taken from the upper part of the cylinder above the plunger, through which by-pass this extra requirement is supplied from the discharge. In this way, we do not detract from the amount of water that is supplied by the lower pumping cylinder, but the cylinder, under these circumstances, simply acts as a part of the discharge pipe.

2 1/2-inch hydro-pneumatic cylinder to be used with a 2-inch pumping cylinder, 12-inch stroke. Price each.....\$11.00

3-inch hydro-pneumatic cylinder to be used with 2 1/2-inch pumping cylinder, 12-inch stroke. Price each.....\$12.00

3 1/2-inch hydro-pneumatic cylinder to be used with 3-inch pumping cylinder, 12-inch stroke. Price each.....\$14.00

20-inch stroke. Price quoted on application.

Fig. 388 Working head

Fig. 388

The Defiance Working Head

For belt, hand or windmill power. It has malleable head, machine cut gears, cock spout, back outlet tapped 1 1/2-inch. Back geared 6 to 1, 6 and 9-inch stroke. Complete on one base ready to connect and run.

Will raise water 150 feet. Speed 35 to 40 R. P. M. Price.....\$25.00

Filled with 3-inch seamless brass air compressor on top. Price.....\$35.00

Fig. 778

Fig. 778

Hand and Power Piston Pump

With air cylinder for hydro-pneumatic pumping. 12x2 tight and loose pulleys. Back geared 4 to 1. Handle can be instantly disconnected when power is used.

The valves are all constructed of metal and are leather faced. Each valve has an individual valve box and to expose or remove the valve, merely unscrew the cap of the valve box, disturbing no other part of the pump.

The air compressor is constructed of 2-inch seamless brass tubing, has its own individual plunger with brass plunger rod—has brass ball valves, with brass seats, and discharges through 3/8-inch pipe into the top of the pump, above the upper valves. It is provided with pet cock, and by opening or closing same, the air supply can be increased, diminished or cut off.

Height over all, 23 inches. Width over all, 19 inches. Length over all, 36 inches. Actual floor space 9x17 inches. 3x5-inch brass lined cylinder, 1 1/2-inch suction, 1 1/4-inch discharge. Price.....\$45.00

Less air cylinder. Price.....40.00

Fig. 1445

"Century" Cog Gear Hydro-Pneumatic Force Pump

The Ratchet Movement Against the Same Pressure will Operate with One-third Less Power than Direct Lever Movement

The pump is fitted with brass lined cylinder, brass valve seats and rubber face valves, each valve located under an individual cap, can be removed without disturbing any of the other parts; has brass covered piston rod with heavy brass stuffing nut.

Fitted with a 2½-inch cast brass air compressing cylinder, bolted immediately under the handle bracket. It is so arranged that the natural movement of the pump handle operates the air compressor. When air is not required this part is detached entirely from the pump by removing the pin that connects the piston rod to the air compressor. The air is discharged from the compressor into the pump above the discharge water valves and directly into the water line.

Price—Hydro-Pneumatic Cog Gear Century Low Down Pump as illustrated above. 3-inch brass lined cylinder, suction and discharge tapped for 1¼-inch pipe. **\$18.00**

"Planet" Double Acting Force Pump

With Individual Air Cylinder for Hydro-Pneumatic Pumping

These pumps with special air cylinders have brass cased piston rods, brass, leather faced valves, brass seats, and brass stuffing boxes. The valves are all on the outside of the pumps and can be readily exposed, or taken out by merely removing the valve box caps which are directly over them.

The air cylinders are separate from the water cylinders. The air supply can be increased, diminished, or cut off entirely, by closing or opening the pet cock at the side of the air cylinder. The air cylinders are of brass tubing 2 inches in diam. and have individual plungers and plunger rods.

The valves used in connection with the air cylinders are brass balls and have perfect seats.

No.	Diameter of Cylinder	Stroke	Suction	Discharge	Price, Iron Cylinder	Price, Brass Lined Cylinder
2	2½"	5"	1¼"	1"	\$17.00	\$18.00
4	3"	5"	1½"	1¼"	18.00	19.00

Bulldozer Power Working Head With 3-in. Brass Air Compressor

For supplying water from deep wells to pneumatic tanks, using ordinary well cylinders or working barrels. Machine cut back gears 5 to 1, suction up to 4-inch pipe. Discharge 2 inch to 3-inch pipe.

Will operate against 75 lbs. pressure, when properly piped and not restricted. The air compressor is a seamless brass body cylinder, mounted directly on the yoke guide of the pump, the piston rod of the pump serving as a piston for the air compressor. The plunger is double leather. The air is forced directly from the cylinder into the discharge pipe of the pump through which it is conveyed to the pressure tank. The entire outfit is complete within itself, mounted ready for operation.

This working head is built especially for deep well work. Its construction insures great lifting power, strength and capacity. The power is applied direct to the piston from the two drive wheels, one on each side of the main stand. By this construction side motion and wear are eliminated.

As the gears are on one side, the work is done on the direct upward motion, the piston passing down on the angle. This insures great lifting power and light wear. All boxes are parted and babitted. Has outer shaft bearer with universal adjustable box; steel pinions.

It is so constructed that by uncoupling the piston (see coupling nut in cut) and removing the piston rod, a 4-inch plunger can be withdrawn through the head. The well pipe is attached to a pipe flange located below the air chamber, hence any size pipe, from 2-inch pipe to 4¼-inch casing can be used by changing the flanges. The pipe can be withdrawn through the base.

Will raise water 200 feet. Should be run not over 35 revolutions per minute and less on deep wells.

Bulldozer Power Working head, with air compressor, 5, 7½ and 10-inch stroke, without water cylinder or pipe (state size of well pipe to be used) Price \$90.00

Channon Special Electric House Pump

For Use With Pneumatic Water Systems in Residences, etc.

Can be operated from ordinary lamp socket without affecting the lights.

Pump on Bracket

This is a compact, substantial, and well-built pump, particularly adapted to all kinds of pumping where a moderate supply of water is required and electric power available, such as pumping soft water into house tanks, as an independent water works plant, or as a booster pump where city pressure is low.

Reliability: This pump is built very strong and compact, with the best material and workmanship. All bearings are very large for the work required, insuring continued good service. Bearings are well provided with oiling devices, and of the same kind as used on the motor bearings. All of them are convenient of access and are easy to inspect and refill.

The cylinder is lined with brass and the piston is made of bronze metal. There are no cup leather packings on

Pump On Legs

the piston, as they are not required. The valves, valve seats and valve caps are all made of good brass, and valves have a protective facing to make them seal tight and free from wear or injury. These valves are of new patented design, and the results of many years' experience in making pump valves for all kinds of work. An important feature is that any one of the valves can be removed by simply unscrewing the nut over the valve clamp.

A motor with ample power is mounted on the top for compactness and drives the pump by a combination belt and silent chain drive, doing away with any gear noise, or belt tightener, and keeping the friction at a minimum. It has also a **special automatic governor clutch** on the shaft pulley. This clutch allows the motor and driving pulley to get to speed before the clutch takes hold to start the pump. The strong motor and clutch drive provide surplus starting power to take care of any drop of voltage in the line. This is necessary to give satisfactory work under all conditions.

This pump can be set on legs on the floor, or fastened to the wall on brackets. It is neat in appearance and an ornament in the house. When furnished with automatic switch for closed tank use, the operation is entirely automatic. Installation is very simple, as no intricate wiring or difficult piping is necessary.

The cost of operation is very small, amounting to only a few cents a day, as it operates from a lamp socket without in any way interfering with the house lights.

Specification No. 1: Capacity 120 to 180 gallons per hour. Suction pipe $\frac{3}{4}$ inch. Discharge pipe, $\frac{1}{2}$ inch. Length of pump, 18 inches, height 18 inches, width 12 inches. Maximum pressure 50 pounds. Weight 100 pounds.

Price of pump complete with automatic electric switch and motor for 110 volt D. C. or 110 volt A. C. single phase, 60 cycle. **\$120.00**

Specification No. 2: Capacity 300 gallons per hour. Suction pipe 1 inch. Discharge pipe $\frac{3}{4}$ inch. Price. **\$160.00**

Hydro-Pneumatic Tank for Pressure Systems

Hot Water Storage Tank for Water Storage Only

Hydro-Pneumatic Tank List

All Hydro-Pneumatic tanks are tested to 125 pounds air pressure and guaranteed for a working pressure of 85 pounds to the square inch.

Manholes ordered in tanks of diameters 48 inches and less, will be placed in the head unless otherwise specified.

Ordered in tanks of diameters over 48 inches, up to and including 84 inches, manholes will be placed in the shell unless otherwise specified.

In tanks 8 feet and 9 feet in diameter, the manholes are always placed in the shell.

Extra Heavy Hot Water Storage Tanks

All extra heavy storage tanks are for vertical or horizontal installation, tested to a hydrostatic pressure of 150 pounds to the square inch, and are guaranteed for a working pressure of 100 pounds per square inch. All extra heavy tanks have double riveted longitudinal seams. All heads are flanged and dished to a radius equal to the diameter of the shell.

Flanged Openings, Manholes, and Handholes

Add to List Price of Tank for Each Extra Opening

Handhole in head or shell.....	\$ 6.00	Flanges 2 or 2 1/2 in.....	\$ 5.00
Manhole in head.....	20.00	Flanges 3 or 3 1/2 in.....	6.00
Manhole in shell.....	30.00	Flanges 4 in.....	7.00

Orders for special tanks, including galvanized tanks, tanks with coils, manholes, etc., cannot be cancelled after work has been started.

Galvanized Steel Tanks

These tanks are made well in every respect, using as few pieces as possible, giving greater strength and less chance of leaking through faulty seams. All tanks are strengthened at the top and bottom by heavy steel angles and are thoroughly riveted, then soldered and carefully tested before shipping. All dimensions given are measured outside and overall.

Notice: All prices given are based on 20 gauge galvanized sheets with black trimmings unless otherwise noted. For 18 gauge advance 30%, for 16 gauge add 60% over 20 gauge price. For all galvanized trimmings add 10%. For all pipe connections add 25%.

Corrugated Tanks

Sheets are stamped, leaving a 2-inch margin of straight metal on both sides, so that the top and bottom angles fit snugly.

The corrugations strengthen the sides considerably and the tank will not be injured by freezing.

If corrugated tanks are ordered, add 10% to prices of plain tanks. If all galvanized corrugated tanks are ordered, add 20% to prices of plain tanks.

Round Tanks

All sizes up to No. 15 can be shipped in box car, ready for use.

Price with fittings, as described, per double section	\$50.00	\$55.00

Enameled Iron Roll Edge All-around Wash Sink

Has painted cast iron legs with braces, fitted with galvanized iron supply pipe, supported on brackets, compression bibbs, compression stop, enameled iron soap cups and standing overflow. Sink has sloping sides so drain is toward center.

Price, 18 inches wide, 8 inches deep, 3 sections as described, with fittings	\$100.00
Price, 24 inches wide, 8 inches deep, 3 sections as described, with fittings	120.00

Automatic Washout Syphon Urinal

Fig. E 895

Furnished in either enameled or painted iron, and with wood or iron flush tank (iron tank regular).

Furnished with automatic syphon flushing tank, flush pipe, washdown spray pipe on back and front of urinal, capping along front, upper and lower traps, and cast iron legs.

Height from floor to top of urinal, 24 inches. Each section 3 feet long.

Prices

Two sections, 3 feet each, painted\$55.00
Two sections, 3 feet each, enameled.....\$90.00

Note.—Air pipe connection with tank and upper trap must be made as shown by dotted lines (we do not furnish the pipe), and particular care should be taken that lower trap is put in, in all cases, otherwise syphon action cannot take place.

Fig. E 890

Porcelain Enameled Roll Rim Urinal

With back cast in one piece. Fitted with brass strainer, coupling, tail pieces and brass perforated wash down pipe with loose key stop.

"U. S." Positive Pressure Blowers

No. 1 Interior

No. 2 Blower

Note interior view above, showing simplicity of construction. The impellers or wings are always flush with the inner shell, therefore even, positive, pressure is supplied. There are no internal gears to get out of line, or worn or to rattle, and the impellers can be replaced by anyone capable of taking off one side of blower and slipping them in place. Pressure is 1 to 3 pounds.

Connersville Rotary Positive Pressure Blowers

For Gas and Oil Furnaces, Brazing, Sand Blast, Laundries, Forge, Etc.

The casing and revolving parts are made of the best grade of soft grey iron, the shafts are of steel and pressed into place and pinned, the gears are cut from the solid blank on an improved gear cutting machine and are fitted and pinned to the shaft. The bearings are of bronze, drilled and grooved for oiling. The inlet and discharge openings are tapped for standard pipe connections. All parts are interchangeable and repairs can be furnished promptly.

When running full speed these blowers make very little noise.

H. Channon Company Chicago

Rotary Vacuum Pumps

Air and Water Cooled

A high grade high duty pump. For use where a high, dry vacuum is required. Where high efficiency, small space, low power, low maintenance cost and minimum attention is desired, it is in a class by itself.

High, dry vacuum pump, such as canning, preserving, milking, etc., is dependant absolutely upon the pump.

It must give an even high vacuum with minimum attention. This pump meets the most exacting requirements fully. There are no valves, piston rings or crank connections to wear out. Its lubrication is perfect and operation noiseless.

The smaller pumps will easily attain a vacuum of 24 inches of mercury air cooled and are for light or intermittent service only.

The larger pumps are water cooled and are capable of easily maintaining continuously a vacuum of 27 inches of mercury at sea level.

The two stage machine will produce vacuum within $\frac{1}{2}$ -inch of barometer.

Noiseless Positive Blowers

For Foundries, Smelters, Gas Exhausters, Pneumatic Carriers, Etc.

A positive blower, free from all complication of gears and intermeshing pistons or revolvers. It will be seen at a glance that the internal mechanism of the blower is very simple and entirely devoid of pistons, revolvers or gearing, on which contact is absolutely necessary to obtain pressure, as in all other positive blowers, requiring additional power by means of the increased friction, also careful attention and frequent adjustment.

"Dureco" Noiseless Positive Pressure Blowers

No. 6

Slow Speed Type

Also used as a dry vacuum pump. Bearings are so constructed as to form their own packing gland. Thus there is no possibility of oil being drawn into the blower when operating under a vacuum or being blown out when operating under pressure.

Operate on pressures up to 5 lbs. running continuously and on dry vacuum up to 12 inches.

No. 1 Size

Blower is of the impeller type but is so constructed that there is no friction between the impellers and the outer casing—all parts being accurately fitted—there is very slight clearance at all times, thus eliminating friction. There are no gears, so machine operates practically without noise.

The blower consists of one casing, two heads, one drum with steel shafts, three or four vanes, depending upon the size of blower and sliding shoes or rollers in each head for supporting the blades of the impellers. Equipped with ring oiling bearings. All sizes above No. 1 $\frac{1}{4}$ bearings are adjustable. Bearings are of bronze. Internal oiling is taken care of by sight feed oil cups.

Cycloidal Shavings Exhausters

Steel Plate Construction

These Fans when properly piped require less power and run nearer noiseless than other types of fans of same size. They are of the slow speed, high efficiency type with chain oiling bearings, making them light running and long lived. Size of Fan denotes height if horizontal discharge, and length if vertical discharge. Built top horizontal or vertical up discharge. All housing bolts exterior to casing and easy of access.

Cycloidal Single Shavings Exhausters

Single and Double Steel Plate Blowers and Exhausters

Exhausters are especially designed for removing shavings, chips and sawdust from wood-working machinery, and for elevating cotton, cotton seed, hulls, etc., or any other fibrous material of the same nature. The bearings are both placed on one side leaving the inlet unobstructed, so as to allow free ingress for such materials. On these exhausting fans we place our patent journal box, which automatically stays in direct line, one journal box with the other. We supply with these journal boxes self oilers.

These exhausters have housings suitable to either hand or any discharge. All changes can be made in a few minutes, and on the outside of the housings. The advantages of the adjustable exhauster are shown in the fact that one exhauster will meet any requirements regardless of the hand or discharge, avoiding all cross belts and sharp angles.

Steel Pressure Blower

For Continuous High Pressure

For supplying blast for cupolas, furnaces, forge fires, sand blast machines, and for any work requiring the forcing of air long distances, high pressure or strong blast. The blower is right or left hand; and this is indicated by the pulley which (when facing the outlet) is on the right hand side when the blower is right hand and on the left hand side when the blower is left hand. The various discharges—bottom or top horizontal, or up or down blast—indicate the direction in which blast is taken from the blower and are self explanatory.

The prospective purchaser of a blower should consider carefully the desired direction of rotation of same in relation to that of his countershaft or driving pulley. All pressure blowers are furnished in the regular discharge, i. e., bottom horizontal right hand, unless otherwise specified; left hand can be had at same price but an extra 10 per cent will be charged for other discharges.

Nos. 1 to 3 have one pulley; all other sizes, two pulleys

Fan (Volume) Blowers and Exhausters

Fan blowers are built especially for use where a large volume of blast is required (instead of great pressure). They are adapted for steam boilers, puddling and heating furnaces, dry rooms, refrigerators, forge fires, ventilation. Two ounce pressure will be sufficient blast for steam boilers, for ventilating. Four ounce pressure with blast pipes in right proportion will give good results on puddling and heating furnaces. The number of forge fires given in table can only be considered as a guide, as all depends on the size of fires wanted and in what location the blower is placed. The best results are obtained when blower is close to the fires, and elbows, especially short turns, are avoided.

Volume Blower

Exhaust Fan

Exhaust Fans

They are especially adapted for ventilating, refrigerating, removing dust from sand and emery wheels, rag and cotton pickers, grain elevators, buffing machines used by shoe manufactures, exhausting smoke and gas from blacksmith shops, etc.

Belt Driven

Champion Blowers

Belt Driven

This blower is intended for blowing fires in portable and small stationary boilers, also for forge fires and various purposes where a small current of air is desired.

- No. 0. Blower, 10 inches high, will blow one fire. Each.....\$ 8.00
 No. 00. Blower, 14 inches high, will blow two ordinary fires. Each... 10.00
 No. 000. Blower, 16½ inches high, will blow three ordinary fires. Each 12.00
 Arranged for exhaust purposes, extra..... 2.00

Electrically Driven

Direct Connected to Motors

One fire variable. Speed blowers Nos. 50 and 51 are equipped with universal motors and can be used with either direct or alternating currents of 110 or 220 volts.

Has six speed changes and detached rheostat with cord and plug to fit any light socket.

The No. 50 is for regular blacksmithing fires.

The No. 51 is the same except that it is built ½ size larger in both motor and blower, giving ½ more blast, which especially adapts it for extra heavy blast as in railway shops, etc.

Styles No. 1 and No. 1E are also for regular fires and are equipped with motors for either direct or alternating current. When ordering for direct current state voltage, and for alternating current state voltage, phase and cycle.

No. 1 has six speed changes with rheostat built in as shown on right.

Nos. 50 and 51

No. 1E is the same as No. 1 except that rheostat is detached as shown on left.

Nos. 1½ and 1½E are the same as Nos. 1 and 1E except that they are ½ size larger for extra heavy fires, and are equipped with universal motors for direct or alternating currents of 110 or 220 volts. The No. 1½ has built in rheostat while the No. 1½E has detached rheostat.

Nos. 1, 1E, 1½ and 1½E

These blowers are all supplied with cord and plug to fit any lamp socket and cost nothing to install.

Prices

- No. 50. Blower, weight 55 pounds. Price.....\$40.00
 No. 51. Blower, weight 85 pounds. Price..... 60.00
 Nos. 1 and 1E. Blower, weight 35 pounds. Price..... 36.00
 Nos. 1½ and 1½E. Blower, weight 50 pounds. Price..... 50.00

Constant Speed Direct Connected

The number of forge fires given in the table below can only be considered as a guide to go by, as it all depends on the size of the fires wanted, and in what location the blower as well as the forges are placed. The best results are obtained when the blower is close to the fires and elbows or especially short turns are avoided. To get the highest results out of a blower run by a one speed motor such as is required for a blower running more than one fire, it must be understood that there are times in electric plants in many cities when they are drawn upon practically to their limit for current, and at such times the voltage is reduced, so that the speed of the blower will be more or less reduced. In order to overcome this, it is always safe to buy the blower fully large enough for the work intended.

These blowers are equipped with motors for either direct or alternating current. When ordering for direct current give voltage or for alternating state voltage, phase and cycle.

No. of Blower	Height in Inches	Inside Diameter of Outlet, Inches	Number of Forge Fires	Price
20	15	3¼	1 to 2	\$ 48.00
2	15	3½	1 to 4	55.00
3	20	4¼	1 to 6	110.00
4	25¼	7¼	1 to 9	115.00

Perfectly balanced—no unequal wear on bearings. The T. & L. pulleys on one side (weight 40 pounds) balance the 40-pound fly-wheel on other side.

Only 1½ H. P. Required.

Air Tank—Size 16x48 inches or larger. It possible to start with system open—\$3.20

The "No. 27" Garage Compressor

Air Cooled—Balanced—Capacity 6½ Cu. Ft.—300 Pounds Pressure

A small, high pressure machine for garage or other work requiring not over 6½ cubic feet of free air per minute compressed to any pressure up to 300 pounds per square inch when used for intermittent service.

This machine will furnish plenty of air for ordinary garage work. Speed recommended, 300 R. P. M. At this speed will run continuously for half a day without overheating and maintain a pressure of 200 pounds.

On a recent test at a speed of 400 R. P. M. 100 pounds pressure was obtained from zero in 4 minutes and 20 seconds, 150 pounds in 8 minutes, 200 pounds in 11½ minutes and 250 pounds pressure in 16 minutes and 10 seconds.

Workmanship and material—All parts are made to the interchangeable parts system and machined to very close fits. The crank shaft and connecting rod are drop-forged steel and all bearings are bronze bushed. Splash oiling. Air from the crank case is utilized for cooling by forcing it through breather tubes at sides of the cylinder. Filler and drain plugs for crank case are furnished.

Piston now supplied with new style leakless piston rings.

Inlet and outlet valves at top of cylinder—away from oil and dirt. Valves are easily accessible and are guided at both ends.

Cylinder..... 3x4 inches
Capacity per minute..... 6½ cu. ft.
Pressures..... Up to 300 pounds
Air inlet..... 1½-inch
Air outlet..... 1½-inch
Shipping weight, 150 pounds Price..... \$46.75

T. & L. pulleys..... 13x2 inches
Fly-wheel..... 14x2 inches
Speeds..... 200 to 400 R. P. M.
Floor space..... 18x14 inches
Height over all..... 21 inches
Price..... \$46.75

Special Relief Valve for any pressure up to 300 pounds, \$3.50.

Special 3-way Cock—to be placed in air line between compressor and tank, making it possible to start with system open—\$3.20

The "Gee Gee" Garage Compressor

Air Cooled—Capacity 7.6 Cu. Ft.—250 Pounds Pressure

An accurately built air compressor of suitable size for the ordinary garage—specially designed for this kind of work to supply the need for a reliable, inexpensive air pump for the most exacting service.

It is extremely simple and runs very quietly—fool-proof, as it has no adjustments requiring constant attention.

Air cooled—no water connections to rust out or freeze. For intermittent service will stand a maximum pressure of 250 pounds without overheating—pressure for continuous service 125 pounds.

The crank-case is enclosed, making it dirt and dust proof. The lubrication is automatic through the oil splash system—no oil holes, oil cups or grease cups anywhere on the machine. Every working part is thoroughly drenched with oil, which prevents wear and insures long life to the pump—at the same time provision is made for keeping the surplus oil from being carried over with the air—so that air could be pumped directly into the tires if desired—instead of through an air tank or receiver.

Trunk or gas engine type piston is used with metallic piston rings—no leather whatever in the construction.

Valves are located in the head—away from the dusty floor, so that the compressor gets the benefit of a pure supply of air. Hardened steel ball valves are used, which require no grinding—they seat quietly—making the machine noiseless in operation and there is practically no wear on the balls.

On a test at a speed of 600 R. P. M. and 150 pounds pressure, after 30 million turns, machine was taken down and every working part found in perfect condition.

Cylinder..... 3x3 inches
Capacity per minute..... 7.6 cu. ft.
Pressure up to..... 250 pounds
H. P. required..... 2 H. P.
Weight with tight pulley, 117 pounds. Price..... \$43.00
Weight with tight and loose pulleys, 135 pounds. Price..... 48.00

With T. & L. Pulleys

Nicely finished in aluminum, making it an attractive looking machine for any garage.

"Midget" Air Pump

A small machine suitable for private garages, dental offices, motor boats and other places where a small amount of air is required.

It is a simple machine, easily dismantled and reassembled. Lubrication is by oil splash system in which every working part is thoroughly drenched with oil—but with provision made for keeping the oil from going over with the air. Pulley, 8-inch diameter. Cylinder is 2x1½ inches. Capacity 1½ cu. ft. of free air at 600 R. P. M.—good for 125 pounds pressure. Weight 30 pounds.

Price with tight pulley..... \$25.00
Price with T. & L. pulleys..... 27.00

No. 1 Double Air Pump

Adapted for small forges, hardening furnaces, brazers, soldering outfits, etc.

Will run at 300 R. P. M. all day without overheating against pressures up to 10 pounds, or will pump into a large tank against pressure up to 40 pounds.

Cylinders are double, 2½x2-inch stroke, speed 250 to 300 R. P. M. Tight and loose pulleys 7½ diameter for 1-inch belt with shifter lever to start and stop. Openings, ¾-inch. Weight 30 pounds. Price..... \$30.00
Floor stand, 18 pounds extra. Price..... 55.00

We supply Transmission and Power Equipment also.

"Gardner" Air Cooled Air Compressors

Enclosed—Self-Oiling

High grade machines—accurately made and good for any air pressure up to 200 pounds for intermittent service or 125 pounds continuous service.

The air-cooled compressor has been found thoroughly satisfactory for garage work, operating small air tools, for vulcanizing work, for blowing dust and other work within its capacity.

The crank case and cylinder is cast in one piece, insuring perfect alignment. Crank case is enclosed for automatic splash lubrication. The trunk style of piston is used with split metallic packing rings (no leather packing being used).

The hardened steel ball valves are in the head and seat so quietly that machine is practically noiseless in operation.

Crank shaft is furnished with renewable bearings.

With Tight and Loose Pulleys

No. 100 Brunner Air Compressor

An air pump of very small capacity intended for use in small garages. It is designed to operate equally well in either horizontal or vertical position. Being small and of convenient size, it is readily adaptable to a wide variety of service. Recommended for garages housing up to 10 cars and to be used in connection with air tanks not larger than 20 gallon capacity for the best service. Built for pressures up to 175 pounds but tested at the factory to 300 pounds. Equipped with adjustable safety valve. Requires ¼ H. P. for operation and delivers 1 cubic foot of free air per minute at 300 R. P. M. Should be operated at a speed of 350 to 400 R. P. M. Height 4½ inches. Floor space 8x11 inches. Cylinder 1½x2 inches. Shipping weight 30 pounds.

No. 100. With 8-inch tight and loose pulleys. Price\$18.00

No. 102 Brunner Double Cylinder Air Cooled Air Compressor

Regularly furnished with 9-inch pulley and friction clutch unless otherwise ordered. It is also furnished with 9-inch or 14-inch single pulley for straight belt drive, or 9-inch tight and loose pulleys upon order.

Cylinders—2 cast en-bloc. Bore—1½ inches. Stroke—2½ inches.

Guaranteed Pressure—175 pounds to the square inch (fitted for higher pressures upon order).

Recommended Speed—300 to 450 R. P. M.

Displacement—At 300 R. P. M., 2½ cu. ft.; at 350 R. P. M., 2½ cu. ft.; at 400 R. P. M., 3 cu. ft. free air per minute.

Outlet—Tapped for ¼-inch iron pipe.

Lubrication—Splash system.

Pulleys—9 or 14-inch as below for 2-inch belt.

Dimensions—Height, 13 inches; floor space, 6½x10 inches.

Power Required at 100 Pounds Pressure—½ H. P.

Finish—Gloss black enamel.

Net Weight—38 pounds.

With 9-inch pulley and friction clutch.....	\$40.00
With 9-inch tight pulley.....	33.50
With 14-inch tight pulley.....	34.50
With 9-inch tight and loose pulley.....	37.00

Brunner Vertical Water Cooled Air Compressors

No. 17 Twin Cylinder. Built for severe service. Drop forged crank shaft, steel connecting rods, all parts easily accessible. 3-inch bore, 6-inch stroke. Guaranteed pressure 175 pounds per square inch. Speed 250 to 400 R. P. M. for continuous service, 400 to 500 R. P. M. for intermittent service. Capacity from 6 cu. ft. at 250 R. P. M. to 12½ cu. ft. at 500 R. P. M. free air per minute. Free lubrication.

Pulley and fly wheel both 16x3 inches. Height 18 inches. Floor space 8½x15 inches over pulley. Power required at 100 pounds pressure, 300 R. P. M., 1½ H. P. Net weight with tight and loose pulleys, 200 pounds. Finish, gloss black enamel.

No. 15 Single Cylinder. Same as No. 17, except bore 4-inch, stroke 4½-inch, speed 250 to 400 R. P. M. for continuous service, 450 to 500 R. P. M. for intermittent service. Capacity from 8.1 cu. ft. at 250 R. P. M. to 17 cu. ft. at 500 R. P. M. Pulley 1-inch diameter. Fly-wheel for 100 pounds pressure. Height 30 inches. Floor space 9x18 inches. 1½ H. P. required at 100 pounds pressure 300 R. P. M.

Curtis Air Compressors

Air Free From Oil

- 1—Controlled-splash self-oiling system, no excess in cylinder, no external leakage nor waste, no oil gets to tires. Closed crank case, keeps out dust.
- 2—One-half pint of oil ample for 100 hours.
- 3—High and low level oil filling gauge.
- 4—Fan fly-wheel assists in cooling.
- 5—Valves of light weight, large area.
- 6—Safety cage under valves.
- 7—Hand unloader permits starting against pressure.
- 8—Adjustable renewable die cast bearings.
- 9—Dropped forged steel crank shaft.
- 10—Head removable without breaking pipe connections or bending pipe. Only one gasket.

No. 60 Electric Garage Air Pump

Air Cooled—Mounted on Truck

A small compact, portable unit for small garages, private garages, filling stations, etc.

For inflating tires direct (without use of air tank).

$\frac{1}{4}$ H. P. motor, silent chain drive, complete.

Inflates a 35x1 $\frac{1}{2}$ tire from flat to 90 pounds in about three minutes. Consumes one-third of a K. W. hour per hour.

Double cylinders are 1 $\frac{1}{4}$ x2 $\frac{1}{4}$. Pistons have ground metal rings. Crank shaft and connecting rods are drop forged. Die cast bearings.

Ring oiling splash system of exclusive design. No oil can enter casing. Double set of valves for each cylinder preventing leakage.

Neutral air chamber between pump and motor.

Prices Complete

110-220 V. direct current..... \$ 90.00

110-220 V. 60 cycle alternating current..... 100.00

25 and 40 cycle, $\frac{1}{4}$ H. P..... 110.00

Prices include hose and all connections ready to attach.

Binks Electric Tire Pump

An efficient, simple and inexpensive portable air pump, suitable for public or private garages. It will inflate a tire as quickly as larger machines as the tire valve opening will not permit faster inflation.

It is made of the best grade of iron, neatly enameled. The cylinder is two inches in diameter, 3 $\frac{1}{2}$ -inch stroke, accurately bored and finished. Metal piston rings of the same grade as in the highest priced compressors. Running parts fitted with spring grease cups and valves of special construction which need no attention and will last indefinitely.

Motor $\frac{1}{4}$ horse power. Operated from ordinary lamp socket.

It is mounted on a 2x12x30-inch platform with swivel castors and is built to withstand hard usage.

The equipment, as illustrated, includes 110-volt direct or 110-volt 60 cycle alternating current motor, 10 feet of discharge tubing, 200 pound pressure gauge and 15 feet of lamp cord.

Price.....\$80.00

Motors for currents other than specified charged extra.

Price List

$\frac{3}{4}$	$\frac{1}{2}$	3.35
$1\frac{1}{4}$	$\frac{3}{4}$	4.35

Cleanall Air Gun

Used in foundries, machine shops, mills, garages, etc., wherever compressed air is available. The air is under perfect control at all times, and the desired volume can be obtained by simply pressing button. It is absolutely tight and there is no leakage of air when not in use. Indispensable for blowing dust from motors, machinery, automobile cushions, etc. Used to equal advantage by bench and machine hands for removing chips and filings where it is impossible to reach with a brush. For cleaning molds in foundries it is decidedly more convenient and practical than the hand bellows.

Class G—Single with Sub-base.

Class H—Duplex with Sub-base.

Gardner-Rix Vertical High Speed Air Compressors

Enclosed Automatic Self-Oiling—Water Cooled—High Pressure

The excellent design and construction of these machines makes high speeds possible, economical and perfectly safe. They are of the enclosed type, dirt and dust proof. Friction has been reduced to a minimum by making all moving parts light, and as these parts are copiously oiled the bearings run cool and do not wear rapidly. The speed ratings given below represent every day service without excessive wear.

Light steel valves insure quiet seating and noiseless running. Easy to understand and install. No stuffing boxes to pack or crossheads to key up. Require little floor space. Light weight, making machines valuable for portable use. Owing to the high speeds can be operated direct from motor. Piston is of the trunk pattern, eliminating crossheads and stuffing boxes.

Price—Compressor with extended base, belt, belt tightener, etc., for motor drive—no unloader and without the motor	148.00	235.00	392.00	525.00	385.00	550.00	830.00

Can also supply low pressure machines of same type—pressures 75 pounds or less—prices upon request. We recommend the sub-base, as with it pulley will clear the floor. Unloader is required where constant pressure is desired. Oil splash lubricated machines must not run slower than minimum speed. Grease lubricated machine (8x6 Class G) may be operated at any speed below the maximum shown in the table.

Electrically Driven Compressor Outfits

With Air Cooled, Enclosed Self-Oiling Compressors
A High Grade Unit Pumping Plant for Garage and Other Uses

Special Short Belt Drive—Quiet and Efficient
Compact and Convenient.

Maximum
Pressure
125 lbs.

Gear Driven with Rawhide Pinion.

These machines are direct-connected to standard motors either through gearing or by the special short belt drive attachment shown.

The gear driven outfit, even with the rawhide pinion, is noisier than the belted and the latter is generally preferable. The floating idler on the belt drive makes a short coupling, provides greater belt contact, prevents slippage, saves room and insures maximum power.

Both styles are mounted on substantial sub-base and are sold at the same price.

Large Direct Connecting Garage Set

Water Cooled Compressor—Includes Receiver

This installation is for those garages requiring large quantities of air, not only for tire inflation, but for cleaning, operation of air tools, etc. It is a complete stationary outfit, consisting of a 4½x4½ Class "G" Water Cooled Gardner-Rix Compressor, capacity 21 cubic feet of free air per minute, connected by Short Belt Drive attachment to a 5 H. P. motor. Compressor and motor are mounted on one cast iron bed plate. The Receiver (18x72 inches) furnished with the set is supplied with brass safety valve, air pressure gauge, drain cock, etc. An automatic starting and stopping device is also furnished. The particular function of this apparatus is to keep the Set under automatic control and thus maintain a practically constant air pressure in the tank.

The Set is made in one size only and is a very superior outfit of sufficient capacity to supply the demands of the larger garages.

Prices

Complete but without Automatic Controlling Device.

Direct Current.....\$425.00

Alternating Current, 2 or 3 phase, 60 cycle, 110 or 220 volts 350.00

Alternating Current, single phase, 60 cycle..... 415.00

Extra for Controlling Device:—Prices on application.

Capacity, 21 cubic feet of free air per minute.

Weight, 1200 pounds.

Portable Air Compressors

The portable gasoline driven air compressors are manufactured in eight sizes ranging from 21 cu. ft. to 450 cu. ft. of free air per minute. Are complete in all details, rugged, light in weight, very economical and easy to operate.

These plants are equipped with enclosed self oiling compressors, having water cooling system separate from that of the engine. Are very simple and require little attention to keep them in good working condition. The entire freedom from intricate mechanisms, requiring delicate adjustments, makes them especially valuable for use in places where best care and attention are not always available.

The air tanks are of ample proportion and allow of a large storage of air.

The gasoline engine is of the four cylinder, four cycle, long stroke, vertical heavy duty type, specially designed for portable compressor work, and is guaranteed to stand up under the hard work that air compressor service requires. Complete with carburetor, magneto, etc. The speed is controlled by fly ball type governor, which is adjustable when running or idle, and can be sealed to prevent tampering.

The jackets of the cylinders are kept cool by specially designed radiator, or cooling tower. A safety starting coupling is provided to enable the operator to start the engine easily and to eliminate back kick. In addition to five large main bearings an outboard bearing is provided to take care of any strain that may come on the bearings when compressor unloader cuts in instantaneously against the full load.

The gasoline is drawn by a vacuum system into the engine from a supply tank located on the rear of the truck.

The engine is connected to the compressor by water proof leather belt, which is kept tight at all times by an idler located so as give the greatest possible contact to the driving and driven pulleys.

It is provided with a multiple disc clutch to insure easy starting and is mounted on a steel truck of heavy construction, having wide steel wheels, oscillating fifth wheel, tongue, neck yoke, and single and double trees. Can also be furnished semi-portable in any of the sizes listed.

Zin-Ho Portable Air Compressor

The Senior Portable Combination Pneumatic Plant

For Calking Lead Joints in Gas
and Water Pipes.

This plant can also be used for any purpose where compressed air is required and where its capacity is sufficient for the purpose. The plant will give a capacity of 20 cubic feet of free air per minute and will operate a pneumatic hammer for calking lead joints; or one plug drill for drilling stone or concrete; or four hand air tools for lettering, tracing and carving marble or granite work; or will operate one riveting or chipping hammer.

The pneumatic calking tool will calk any kind of a lead joint satisfactorily, as its rapid and powerful strokes make a firm joint. The lead wool however is preferable. This plant is being used extensively by gas and water companies, also by contractors in the U. S. and Canada for calking lead in main pipe joints.

The pneumatic calking hammer does the work of several men and makes the joints more firm and perfect. It is an impossibility to calk lead into joints by hand as firmly and satisfactorily as with the pneumatic hammer; besides, the pneumatic hammer will do the work in **one-fifth** the time required by hand calking.

This machine differs from others as the engine and compressor are combined into one machine. The air-piston is connected on the same shaft with the engine piston, making what is termed a double-throw method which gives the same power to compressor-piston as to engine piston—making a very compact outfit that is self-contained. The engine is hopper-cooled, with gasoline in base, and is ready for operation upon arrival.

Another improvement is the piston-discharge valve used instead of the old style stem valve. This valve increases the efficiency about 15 per cent and is practically indestructible. Compressor is equipped with an unloader which automatically relieves the load on the engine when the proper pressure is attained; unloader can be set at any pressure up to 125 pounds.

The engine is equipped with magneto for ignition and has a suction carburetor and is thoroughly up-to-date in every respect.

The "Senior" plant consisting of 5 H. P. gasoline engine, hopper cooled, compressor $4\frac{1}{2} \times 6$, air cooled, capacity 20 cubic feet of air, 20x60-inch air tank complete with fittings, truck with $12 \times 4\frac{1}{2}$ front and $16 \times 4\frac{1}{2}$ rear wheels. Weight, 1650 pounds.

Price with truck..... \$450.00

Air hose and couplings, pneumatic tools, jute packing, also oakum (plumbers' spun) are listed elsewhere in catalog.

Ingersoll-Rand Air Compressors

Pressures up to 125 Pounds

Class "ER-1" Belted

Class "FR-1" Steam Driven

Latest improved types—Single stage air, double acting, dust proof enclosed construction, automatic lubrication, Ingersoll-Rand inlet and discharge valves. Can be furnished with tight and loose pulleys on the 6 and 8-inch stroke sizes on special order at extra cost. The straight line steam driven machines have improved balanced piston steam valves.

Imperial Type 12 Vertical Air Compressors

Self-oiling, enclosed type. Air pressures up to 150 pounds.

Single stage air, single acting of the dust proof enclosed construction with automatic constant level splash lubrication.

Ring inlet valve on the 4 1/2 x 5 size. No inlet valves on the smaller sizes. Plate discharge valves on all sizes.

Furnished with either single pulley or tight and loose pulleys as ordered.

The standard machines are water cooled for connection to pressure system. The hopper or reservoir type has the cylinder jacketed which in connection with the reservoir head forms an efficient thermo-siphon cooling system.

Smallest size air or water cooled at the same price.

Be sure to state cooling desired.

The Short Belt Drive For Air Compressors

Has many good features. The idler pulley floats on the belt and while it is light its weight is sufficient to take up the slack and hold the belt against the driving pulley, giving greatest possible belt contact and relieving pressure on the bearings.

This style of drive makes a compact, noiseless unit, lower in first cost than a direct connected outfit because standard motors can be used.

Prices quoted upon request.

Gardner Horizontal Air Compressors

Class "B-S" Belted

Class "S-S" Steam Driven

Enclosed, automatic self-oiling type, permitting higher speeds than the older style open frame machines. Massive frames, bored guides, balanced fly-wheels, light seating valves, easy adjustments. Discharge valves, steel and cup shaped, poppet type, light and durable—inlet valve is a ground light steel disc—seating very quietly. Valves are set radially, giving good cooling—around cylinder walls also through both heads. Piston is double acting with spring rings—travels with minimum clearance, 1-32 to 1-16, giving high volumetric efficiency. First four sizes are of the open frame type.

Class D—Belted

Duplex Compressors

Capacity 58 cubic feet of free air per minute and larger. Belted, steam or electrically driven, also compound machines, quoted upon request.

No. 71 Contractors Portable Compressed Air Plant

For operating air tools of any kind in sewer or road work, structural steel erection railroad or general contract work.

Will operate: One large size 3 1/4-inch rock drill, three Jackhammer or similar small rock drills, 10 to 15 air riveting hammers, 7 to 8 chipping hammers, one 4x7 1/4-inch sheet pile driver depending of course upon variable conditions.

The outfit is generally furnished complete mounted on trucks as shown but we can supply boiler mounted on skids if desired.

The boiler is rated at 30 horse power and built for 125 pounds steam working pressure, under normal conditions. The boiler has additional capacity for operating a steam pump or syphon for freeing the excavation of water. The stack is hinged and self-supporting.

The compressor has a rated capacity of 150 feet of free air per minute to a receiver air pressure of 100 pounds per square inch. Both steam and air ends of the compressor are compounded so that steam and fuel consumption are moderate.

Approximate weight complete, 12000 pounds. Prices upon request.

Gasoline Driven Compressors Quoted Upon Request

Buckeye Sand Blast Outfits

The Buckeye Sand Blast Outfits Are the Only Ones Which Operate Without Valves

In place of a sand valve is what we term an adjuster which only requires to be set when the nozzle size is changed. In other words, if the same size of nozzle is used all the time, no attention to the adjuster is necessary. The only valves to operate are the air valves.

Especially valuable for removing rust, scale, old paint, etc., from the surface of exposed steel or other metal work, such as bridges, factory buildings, gas, oil and water tanks and structural work of all kinds.

The Buckeye machine is strong, light and easily portable, and is better adapted to this work than any other. The rust is rapidly cut away and the rivet heads are left clean. The greatest merit of the sand blast is that it removes every trace of dirt, scale, rust or grease from the surface, which is everywhere exposed bright and perfectly cleaned.

This is an ideal condition to secure the strong adhesion of the paint so that as far as possible it will protect the metal.

The thoroughness of the cleaning effected by the sand blast is noted especially upon metal surfaces which have been pitted by rust and corrosion to a considerable degree. The pitted portions are thus cleaned as thoroughly as the other places. It also reaches and cleans effectually every portion, angles, and on the edges of the different sections of a beam, girder or post, on and around the rivet heads, and in many other places entirely inaccessible to the wire brush or steel scraper, or on which they are used with great difficulty and little effect.

Steel exposed to the blast and gases from locomotives will wear out any paint, and the Sand Blast is able to meet all calls. The life of those structures already in existence and others that may be built in the future should be extended as long as possible by the use of the best means that can be commanded.

Sand Blast on Wheels

Machine Complete as Above

No.	Price Each	Tank Capacity of Sand in Pounds	Approximate Gross Weight in Pounds
1	\$150.00	300	250
2	240.00	600	450
3	300.00	1000	900

5	540.00	4000	1500
6	750.00	8000	3000

Machine Fitted on Two or Four Wheel Truck, as Shown at Left

No.	Price Each	Number of Wheels on Truck	Approximate Gross Weight in Pounds
1	\$210.00	2	400
2	300.00	2	600
3	360.00	4	1200
4	500.00	4	1500
5	650.00	4	2000

The prices shown above include the following equipment: Tank with all valves and fittings, special hose having a pure gum lining as follows: 12½ feet with sizes No. 1 and No. 2 and 25 feet with Nos. 3, 4, 5 and 6. Extra nozzle holder, a number of extra nozzles, head cover and various sundries necessary for a complete outfit.

"Morse" Improved Diving Apparatus

Illustrating U. S. Navy Standard Diving Outfit

We are Western Agents for A. J. Morse & Son, Sole Manufacturers of Diving Apparatus to the United States Navy and Engineer Corps

"There's nothing too good where life is at stake." Morse apparatus is the best.

Diving apparatus is used by contractors, bridge builders, mines, railroads, wrecking and towing companies, water works for examination and repairs, and by pearl, shell or sponge fishers. We furnish outfits for shallow diving as well as for deep sea work up to 200 feet.

The armor consists of helmet to protect the head; dress, of canvas and rubber, attached to the helmet; shoes, with lead or iron soles to keep the feet down, and the body upright; lead weights to sink the diver to the bottom and prevent his rising from an over-pressure of air from the pump.

The life line is used in lowering or raising the diver, and for transmission of signals between the diver and his attendant.

The diver is first dressed in the flannels, then equipped with the dress, shoes and weights; the helmet is then attached with air hose connected, the pump started, and he is slowly lowered to the bottom.

The most important and highest priced part of the equipment is the air pump. This piece of mechanism must be absolutely safe in every respect as the life of the diver depends upon its successfully supplying the air required. This air must be cool and the pressure equalized properly. There must be no oil or other fumes pumped to the diver.

These air pumps are manufactured in many different styles to supply air in a few feet of water up to depths of over 200 feet, which is considered the limit for deep sea work. Usually furnished in a strong chest or box with heavy fittings for handling and equipped with valves of special design so arranged that they can be examined, repaired and renewed without removing the pump from the chest.

Helmets are made of polished and tinned copper with gunmetal. They are made up on iron forms and are uniform in shape and designed for the diver's comfort. They do not cut the shoulders. Helmets consist of two parts—a head piece and a breast plate. All helmets are equipped with special safety valve which has prevented many accidents, as in the event of the air hose being jammed or cut, sufficient air is retained in the helmet to allow the diver to reach the surface in safety. The regulating escape valve enables the diver to control the escape of air to facilitate his going down and coming up.

Send for special illustrated catalog giving complete instructions for diving.

"Morse" Air Pumps for Diving

Each Pump is run by steam power, before shipping, to develop its capacity and test its efficiency.

Fig. G—Shows No. 3 Air Pump

Air Pump No. 1

This is the U. S. government official standard pump.

Has capacity for two divers working simultaneously down to 100 feet, or one diver only in very deep water.

Pump has two cylinders, double action, with two patent indicating gauges to denote the air pressure and depth of each diver; with water cistern, two flywheels, in ash chest, with iron rings for lashing. Weight, 750 pounds.

Price.....\$500.00

Air Pump No. 1-A

U. S. navy standard for use on smaller ships. Will supply air for one diver to 100 feet depth.

Pump is single cylinder, double action, with patent indicating gauge to denote air pressure and depth of diver, water cistern, one flywheel, in ash chest, with iron rings for lashing. Weight, 550 pounds.

Price.....\$300.00

Air Pump No. 2

For deep-sea diving, pearl and sponge fishing, wrecking and general work. Will supply air for one diver in 150 feet of water.

Pump has three cylinders, open top, single action, with water cistern, patent indicating gauge, to denote air pressure and depth of diver, two flywheels, ash chest, polished brass corners, with iron rings for lashing. Weight 750 pounds.

Price.....\$400.00

Air Pump No. 3 (Shown Above)

For service in moderate depths, rivers, harbors, etc., for contractors, railroads, mines, etc. Will supply air for one diver in 100 feet of water. Pump has two cylinders, open top, single action, has gauge, one flywheel, two handles, ash chest, iron corners, with iron rings for lashing. Weight 690 pounds.

Price.....\$250.00

Air Pump No. 4

For examinations, and all work of brief duration in shallow water. For waterworks, sewer department and contractors. Will supply air in 50 feet of water. Pump has single cylinder, double action, in ash chest. Weight 150 pounds.

Price.....\$125.00

Air Pump No. 5

For shallow water and light service up to 30-foot depths. With folding brake mounted on plank, without case, two cylinders, single action. Weight 100 pounds.

Price.....\$75.00

Air Pump No. 6

Designed for mule back transportation. Weight complete, 270 pounds. Will supply air in 65 feet of water. Pump has extra large cylinders and special air valves. Will supply air in 200 feet of water. Pump has three cylinders, open top, single acting, water cistern, indicating gauge, two flywheels, two handles, ash chest with iron corners, iron rings and removable front. Weight 750 pounds.

Price.....\$200.00

Continental Air Pump No. 7

Specially designed for sponge and pearl fishing and all deep-sea operations requiring an extra powerful pump. Pump has extra large cylinders and special air valves. Will supply air in 200 feet of water. Pump has three cylinders, open top, single acting, water cistern, indicating gauge, two flywheels, two handles, ash chest with iron corners, iron rings and removable front. Weight 750 pounds.

Price.....\$400.00

"Morse" Complete Diving Outfits

Showing No. 3 Pump
out of its Case

No. 3 Outfit

Complete in all respects for one Diver working
in depths to 100 feet.

This is not only the most popular diving outfit on the market, but is the one best adapted for general use.

Recommended for contractors and railroads for service in moderate depths in rivers, harbors, etc.

The No. 3 pump has two cylinders with open tops, single acting, with patent indicating gauge to denote air pressure, also depth of diver, two fly-wheels, water cistern, oil reservoir, ash chest with iron corners, two handles and ring for lashing.

This pump has a removable till fitted into the pump case containing the following spare parts:

One union joint, double, male	One 10-inch monkey wrench
One union joint, double, female	One can spare cup leathers
One overflow nozzle	One socket wrench
One oil can	One screw driver
One spare handle nut	One spare valve
Also 12 spare leather washers for air couplings.	

Price of No. 3 Outfit

1 No. 3 air pump, described above.....	\$250.00	6 feet snap tubing, at 60c.....	\$ 3.60
1 Improved diving helmet, 3 lights, sectional screw to receive air in head or air in breast plate style as desired, with recessed gasket seat, safety valve and regulating valve.....	100.00	1 Pair chafing pants.....	4.00
2 No. 2 size diving dresses, at \$50.00.....	100.00	2 Pairs diver's stockings, at \$1.25.....	2.50
3 50-ft. sections standard air hose, coupled.....	60.00	2 Woolen shirts and drawers.....	6.00
1 Set diving weights, Fig. 100.....	22.00	2 Pairs woolen mittens.....	2.50
1 Pair Fig. 103 diving shoes, lead soles.....	15.00	1 Woolen cap.....	1.25
2 Pairs rubber diving mittens, at \$5.00.....	10.00	1 Basket for helmet, hose, etc.....	18.00
1 Pair rings and clamps.....	5.00	1 Helmet cushion.....	3.00
150 Feet life or signal line.....	2.50	6 Extra bolts and nuts for helmet.....	3.00
1 Pair cuff expanders.....	5.00	1 Set of extra hose couplings.....	2.00
1 Fig. 98 knife, belt and hose holder.....	10.00	1 Yard rubber repair cloth.....	2.50
Approximate shipping weight, 1000 pounds.		1 1-lb. can rubber cement.....	.75
		1 Cutting punch.....	.75
		Total price.....	\$629.35
		Contents, 43 cubic feet.	

Other Complete Diving Outfits

The outfits below consist of about the same list of sundries as given for No. 3 outfit above. The air pumps, the most important item, are described on another page. These regulate the number of divers as well as the depths to which one or two divers can safely go and still have plenty of cool, clean air to do the work. The helmets are practically the same for all outfits and are also described elsewhere.

"Morse" Improved Safety Diving Helmets

The above illustration shows No. 1, the most popular helmet in use. Fitted with 3 lights as shown and also with a top light.

No. 1 Helmet—Has sectional screw, safety valve, regulating escape valve and recessed gasket seat. Receives air in the head-piece.

Price, with 3 lights (as shown), weight boxed, 77 pounds.....\$125.00
Price, with 3 lights and top light, weight boxed, 77 pounds.... 137.50

The top light allows the diver to look upward without throwing the body back.

No. 2 Helmet—Is exactly the same as No. 1 except that it receives air in the breast plate instead of head-piece. Same prices as No. 1.

No. 3 Helmet—Has flanges and five swinging bolts, receives air in head.

Bolt pattern, 3 lights, weight boxed, 80 pounds.....\$156.25

Bolt pattern, 4 lights, weight boxed, 80 pounds..... 168.75

Speaking Apparatus—Consisting of a rubber tube connected with a hearing and speaking disc inside the helmet, with a mouthpiece on other end for use of a helper.

Price, with 50 feet of speaking tube.....\$112.50

Electric Breast Lamp—Fitted with special lens and 16 candle-power incandescent lamp, also 125 feet of cable.

Price.....\$50.00

"Morse" Improved Water-Proof Diving Dresses

Fig. G. 60. Standard Dress

Fig. G. 61 Standard Dress
Distended with Air

Fig. G. 62. Laced Dress

Morse diving dresses are very carefully made from the best materials obtainable and represent many years of experiment and experience and can be relied upon to give entire satisfaction. Each dress has inside cape to pull up around the diver's neck and is reinforced in parts exposed to most wear. The standard dress is made of white cloth with gray rubber gasket and cuffs. Fig. G. 61 shows the standard dress distended with air making it difficult for the diver to rise from a kneeling or reclining position. Fig. G. 62 gives a rear view of the latest style laced dress which prevents the distending of the lower part of the dress, allowing him to move about more freely and assists him in maintaining an upright position.

Diving dresses must not be packed away when wet or damp. They should be well dried inside and out or they will mildew and rot.

Sizes: Always give height of diver or number when ordering. No. 1 for diver 5 feet 6 inches. No. 2 for diver 5 feet 8 inches. No. 3 for diver 5 feet 10 inches. No. 4 for diver 6 feet to 6 feet 2 inches.

Price of standard dress, same as Fig. G. 60.....\$60.00

Price of laced dress, same as Fig. G. 62..... 70.00

Canvas dress overall to be worn over dress to prevent chafing. Price..... 6.25

Net weight of each dress is 16 pounds; packed, about 26 pounds.

"Morse" Wading Trousers and Suits

Fig. G. 65
Wading Trousers
With Boots

Made of strong waterproof material with rubber boots attached and have buttons and straps for lacing and leather belt.

Price.....\$27.00

Fig. G. 66
Wading Suit
Fastens Around Neck

Made of same material as Morse diving dresses and is fitted with brass eyelets and cord for securing it around the neck.

Price.....\$65.00

Fig. G. 67
Wading Trousers
Without Boots

Same as Fig. 65 but without the rubber boots. To be used with heavy leather shoes.

Price without leather shoes.....\$55.00

Price with leather shoes.....65.00

Fig. G. 60

Telephones for Divers

To make this style compact as possible, we place the battery in strong ash case, with space for receiver and transmitter when not in use.

Combines our latest improvements and is found most desirable for general service.

Complete with battery, 120 feet cable, receiver, and transmitter for attendant.

Receiver and transmitter for helmet.....\$125.00

Price does not include helmet.

Fig. G. 99

Morse Patented Graduating Diving Weights

As each weight can be instantly removed, the diver can adjust the amount to any desired depth.

Lead weights in gun metal pockets, broad waist belt, and two shoulder straps.

Price, per set,.....\$37.50

Fig. G. 100.

Gun metal, per set, \$3.00
Four clamps,75

Crinoline

To be worn under dress in deep water. Heavy
rattan, canvas covered, with shoulder straps.

No. 71. Price, \$10.00

Helmet Cushion

To be worn under the dress for ease of diver's
shoulders, breast and back. Canvas, filled with
horsehair.

No. 70. Price, \$4.00

Channon 20-Inch Double Back Geared Upright Power Drill

Cut Gears—Ball Bearings—
Eight Speeds—Three Feeds

The Channon 20-inch Double Back Geared Upright Power Drill is a strictly high class machine tool, fit for the finest shop, with all the modern improvements and automatic features usually found only on the most expensive drills. Offered at a very reasonable price.

The gears are accurately cut from solid metal, insuring easy running and minimum wear. Spindle is furnished with graduated and automatic features, found on the most expensive drills. Spindle is counterbalanced by a weight in the hollow column. It has automatic stop attachment with quick return lever, giving rapid movement to the spindle. Has screw for raising and lowering the table. The change from a plain drill to a double back geared drill is accomplished instantly by sliding the gears.

All adjusting features are close to the operator's hand and so arranged that the various operations, such as starting, stopping spindle, changing speeds, engaging and disengaging from self-feed to lever-feed, lowering and raising table, etc., are under practically instantaneous control by the operator.

Special Features. Double Back Gears—machine cut; ball bearings; square base; eight speeds; instantaneous control; three complete feeds; power, screw and hand lever; graduated spindle, counter-balanced; automatic stop attachment with quick return.

Capacity and Speeds. Drills holes, 0 to $1\frac{1}{2}$ inch, to center of 20-inch circle. Spindle $1\frac{1}{4}$ -inch diameter. Bored for No. 4 Morse Taper. Four step cone pulleys for 2-inch belt; tight and loose pulleys 8 x $2\frac{1}{2}$ inches.

Speed for ordinary work 300 R. P. M. Weight 800 pounds. With square base, complete as described above.

Price with back gears.....\$130.00
Price, without back gears.....100.00

Channon Power Bench Drill No. 0

A Strictly High Grade Powerful and Well Built Bench Drill.
Complete in Every Way

The top of the drill base is planed off to use as a table when the regular drill table is turned to one side. This gives a distance of 16 inches between spindle and base table. The counter shaft has a belt shift on the tight and loose pulleys and the feed lever is operated with a spring arrangement which automatically keeps the lever in its place at all times.

It will bore any hole up to $\frac{3}{8}$ inch with ease. Particularly adapted for garages, pattern and machine shops, or wherever rapid and accurate drilling is done.

Price.....\$30.00

Dimensions. Drills to center of 9-inch circle. Bores holes to $\frac{3}{8}$ inch diameter. Vertical movement of spindle $3\frac{1}{4}$ inches, of table 9 inches. Maximum distance spindle to table 10 inches, to planed base 16 inches. Diameter of column $2\frac{1}{2}$ inches. Size tight and loose pulleys 4 inches x $1\frac{3}{4}$ inches. Cone pulleys $4\frac{1}{2}$ inches x $1\frac{1}{2}$ inches and 3 inches x $1\frac{1}{4}$ inches. Spindle bored to No. 1 Morse Taper Hole. Height 32 inches. Weight 100 pounds.

No. 50 Radial Drill

For Wall or Post Attachment

A new drill adapted for work in shops where a drill of this kind is a necessity, but the price has heretofore been prohibitive. It combines several drills in one and covers a wide range of work. Spindle has quick return hand lever in addition to regular hand feed. Height of drill, 56 inches.

Drills to center of circle outside column, 64 inches. Greatest distance of center of spindle to column, 7 inches. Smallest distance of spindle to column, 7 inches. Greatest distance of spindle to table, 18 inches. Traverse of spindle up and down, 9 inches. Diameter of spindle inside of sleeve, 1 5/16 inches. Diameter of column, 5 1/2 inches. Size of cone pulleys, 8 3/4, 7 3/4, 5 3/4, 4 x 2 1/4-inch face. Diameter of tight and loose pulleys 8 x 2 1/4-inch face. Speed of countershaft about 380 R. P. M. Spindle, No. 3 Morse, will carry 1 1/4-inch drill. Equipped with gear guards (not shown) and countershaft, but no post. Weight, 800 pounds.

Price.....\$250.00

Channon 14-Inch Upright Power Drill

The Channon 14-inch upright power drill is a gear-driven drill of the best and most improved construction. It combines the simplicity, speed and ease of operation of a sensitive drill with extreme power not usually found on drills of this kind.

All beveled gears are planed, guaranteeing a perfect and smooth running drill. The bearings are large and powerful, the upper bearing being split to take up wear when necessary.

The table is tilting and can be clamped permanently at any angle, and with the angular bracket makes it very convenient for complicated work. It has a screw for raising and lowering the table, which is quick acting, the table remaining firmly where it is placed. All gears are carefully guarded.

Height of drill, 69 inches. Distance between table and spindle, 34 inches. Distance between spindle and base, 45 inches. Distance from column to center of spindle, 7 1/4 inches. Diameter of column, 4 inches. Traverse of table on column 27 inches. Size of table, 11x11 inches. Diameter of spindle, 3/8 inches. Traverse of spindle, 6 1/2 inches. Size of tight and loose pulleys, 7x2 1/2 inches. Size of cone pulley (four steps), 7 1/4-6 1/4-5 1/4-3 1/4 x 1 1/4 face. Speed of driving pulleys, 225 R. P. M. Floor space, 16 x 18 inches. Capacity, 3/8 inch. Horsepower required, 1 H. P. Hole in the spindle bored to fit No. 2 Morse Taper. Weight crated, 490 pounds.

Price.....\$70.00

Channon Sensitive Bench Drill No. 50

For Light and Rapid Drilling

The Channon Sensitive Bench Drill is exceedingly substantial, strong and well built, and is particularly adapted for light, accurate and rapid drilling, in garages, pattern and machine shops.

This drill is driven exclusively by belt and with the aid of cone pulleys, two separate and distinct speeds can be furnished. The countershaft is furnished with a belt shifter on the tight and loose pulley, and the feed lever can be returned without affecting the position of the bit by a patented automatic device in the feed lever hub. This drill is made in the best possible manner and guaranteed in every respect.

SPECIFICATIONS

Table swinging 180 degrees horizontally.
End thrust ball bearing.
Adjustable spindle stop.
Greatest distance from spindle to table, 7 1/4 inches.
Up and down movement of the spindle 2 1/2 inches.
Up and down movement of table 7 inches.
Diameter of table 8 inches.
Drills to center of 10-inch circle.
Drilling capacity 3/8-inch.
Size of tight and loose pulley 4x1 1/4 inches.
Speed of driving pulley 550 R. P. M.
Extreme height, 27 1/2 inches.
Weight 65 pounds.
Price complete with Star Chuck.....\$20.00
Price without chuck.....19.50

No. 15 Plain Milling Machine

A practical jobbing machine, on account of its extreme range, and suitable for every kind of plain milling. The knee has been made solid on top with an extended bearing on the column, adding very materially to the already solid character of the machine and its capacity for table work. It is equipped as follows:

Movement of table by large hand wheel.
Quick return to table, 2 inches per turn.
Feed changes by cone pulley and change gears.
Feed trip and reverse. Saddle fitted with taper gib.
Micrometer adjustments for knee and saddle.
Oil-groove base. Two-speed friction countershaft.

Length of automatic feed table, inches	42
Adjustment in line with spindle, inches	10 1/2
Vertical adjustment under spindle, inches	21
Dimensions of table, inches	42x12
Number of T-slots in table	3
Size of T-slots in table, inch	3/4
Greatest capacity for work between column and arm braces, inches	21 1/2
Swing under arm, inches	13 1/2
Arbor hole in spindle, B. & S. taper, No.	10
Thread on nose of spindle, 2 1/2-inch diameter, 8 pitch, L. H. V.	12 1/2
Largest diameter of cone, inches	3
Width of belt required, inches	4
Number of steps on cone	9-476
Range of speeds, R. P. M., geometrical progression	16
Changes of speed by cone, back-gears and countershaft	12
Number of feed changes	005-2
Range of feeds in geometrical progression, inch	6x3 1/2
Capacity of vise furnished, inches	14x4 1/2
Friction pulleys on countershaft, inches	110-320
Speed of friction pulleys, R. P. M.	75x58
Floor space required, inches	2700
Domestic shipment, crated, weight, pounds	94
Foreign shipment, tight-boxed, size, cubic feet	3200
Foreign shipment, tight-boxed, weight, pounds	

Price.....\$725.00

No. 1 Universal Milling Machine

A very popular machine where a universal miller is required. Equipped with solid top knee, square locked, and is practically chatter proof.

Equipment

Double geared dividing head and elevating tail stock; 3 extra dials; No. 13 swivel vise and crank; 1 supporting jack; 1 extension plate; 1 6-inch three-jaw universal chuck; 1 10x7 B. & S. taper socket; 1 No. 1-C milling machine arbor; 1 arbor draw-in rod; 1 oil pot and swinging arm; 2 chip pans; 1 micrometer table stop; 1 table trip screw and nut; 9 gears; 12 bolts; 1 index board; 5 wrenches—1/4-inch hexagon, 1 1/4-inch hexagon, 1 1/2-inch hexagon, 3/8-inch hexagon x 1/2-inch square, and No. 3 spanner; 1 triple friction countershaft; 2 arm braces and knee yoke.

Dimensions

Length of automatic feed of table, inches	22
Adjustment in line with spindle, inches	8
Vertical adjustment under spindle, inches	18
Dimensions of table over all, inches	41x11 1/2
Dimensions of table inside oil pockets, inches	37x7 1/2
Number of T-slots in table	3
Size of T-slots in table, inch	3/4
Greatest capacity for work between column and arm braces, ins.	19
Swing under arm, inches	13
Arbor hole in spindle, B. & S. taper No.	10
Thread on nose of spindle, 2 1/2-inch diameter, 4 pitch, L. H. V.	12
Largest diameter of cone, inches	2 1/2
Width of belt required, inches	16
Number of speed changes	10-327
Range of speed, R. P. M., geometrical progression	8
Changes of speed by cone and back gear	16
Increased by countershaft to	12
Number of positive feed changes	002-08
Range of feeds in geometrical progression, inch	No
Automatic feeds in all directions	10
Swing of centers, inches	20
Distance between centers, inches	1 1/2
Diameter of hole through dividing head, inches	5x2 1/2
Capacity of vise furnished, inches	14x3 1/2
Friction pulleys on countershaft, inches	120-160
Speed of friction pulleys, R. P. M.	52x60
Floor space required, inches	2575
Domestic shipment, crated, weight, pounds	60
Foreign shipment, tight-boxed, size, cubic feet	2725
Foreign shipment, tight-boxed, weight, pounds	

Price.....\$910.00

U. S. Hand Milling Machine

This machine has more power than any machine on the market of equal size. The vertical and horizontal feeds are independent. The spindle head is accurately counterbalanced and has vertical lever feed. The hand lever feed on the table can be operated on either side of the table.

The elevated screw on the knee is fitted with ball thrust bearings to reduce the friction in raising and lowering the knee.

The table is made with a hand lever feed, also with a crank feed, which is operated with rack and pinion. A weight attachment is furnished so that the head and table can be fed automatically. Adjustable stops are furnished for the table and head to limit the travel in either direction.

A great many milling operations are being done on heavy expensive machines that could be done on this machine easier and faster.

Specifications

Hole in spindle is No. 9 B. & S. taper.	
Dimensions of table, inches	5x22
Adjustment of table under spindle, inches	16
Adjustment of table in line with spindle, inches	7
Table feed with hand lever	6
Table feed with crank	16
Vertical lever feed on spindle head	5
Top of table can be brought on level with center of spindle.	
Top of table is furnished with standard T-slot $\frac{3}{8}$ -inch wide.	
T. and L. pulleys on countershaft, inches	8x3 $\frac{1}{4}$
Speed of countershaft, R. P. M.	230
The grade cone 7-inch and 10-inch give four spindle speeds,	
96, 197, 268, 547 R. P. M.	
Back shaft pulley, diameter inches	6
Size of foot of base, inches	23x26
Floor space over all, inches	27x37
Net weight, pounds	900
Weight boxed for export, pounds	1200
Contents of box, cubic feet	40
Price	\$225.00

No. 1 Plain Milling Attachment

The spindles are of crucible steel, hardened and ground and have No. 7 B. & S. taper hole in the lower end and a hole clear through for draw-bolt. The bearings are of extra bronze and are carefully scraped to fit. Adequate provision is made for compensation for wear.

Price.....\$61.50

No. 2 Universal Milling Attachment

It especially adapts the U. S. hand miller for die sinking, profiling and all classes of light milling, where small cutters are used. It is graduated and can be quickly adjusted to any angle or position required, making it universal.

Price.....\$86.50

No. 5 Keyseat Milling Machine

Counter shaft pulley, plain machine 14x4 $\frac{1}{2}$ inches. Speed 165 R. P. M. for router machine 14x4 $\frac{1}{4}$ inches. Two speeds, 165 and 285 R. P. M.

Router spindle has 3 $\frac{3}{4}$ -inch independent vertical adjustment and No. 7 B. & S. taper hole.

Weight, 48-inch plain machine, 2,500 pounds. Weight, 48-inch complete machine, 2,700 pounds.

The Routing Attachment has independent vertical and horizontal adjustments, and is driven, through change gears, from the main driving gear. When this attachment is furnished the machine is provided with two speed countershaft, giving in addition to proper speed for horizontal cutters, speeds for Routing Cutters varying from 135 to 350 R. P. M. The operation of squaring up the ends of a keyseat is performed immediately after keyseat has been milled, without disturbing the horizontal adjustment of either cutter, or unchucking the shaft. After the keyseat has been milled the saddle is lifted until the horizontal cutter clears the shaft, the router spindle is lowered with its own adjustment until its cutter bottoms in the keyseat, and first one end, then the other, is routed. The attachment if not in use may be removed from the machine with little effort. Its use simplifies the production of keyseats for leathers or drop-keys.

Portable Key Seater

Will Mill Keyseats in middle or end of shaft from 1 $\frac{1}{4}$ to 5 inches diameter without removing from its hangers. Will mill up to 1 $\frac{3}{4}$ x $\frac{3}{8}$ inches full width, at one cut and 12-inch length without resetting. A set of 5 cutters is furnished with each machine by using one or more of which on the spindle, keyseats of any of the following sizes may be cut with one operation:

No. 1. Price each, \$50.00
Weight, net, 76 pounds.

No. 2.

Will mill keyseats in the middle or on the ends of shafting from 1 $\frac{1}{2}$ inches to 8 inches in diameter, without removing it from its hangers.

Five milling cutters are furnished with each machine. Will cut with one operation the same sizes as No. 1.

No. 2. Price each, \$100.00
Weight, net, 200 pounds.

Hub Keyseaters

"Burr" Hand Key Seater
For Hubs of Wheels, Etc.

For Cutting Straight or Taper Keyways up to $1\frac{1}{2}$ Inches
Wide in Bores Not Over 12 Inches Long

Portable

Will cut keyways in work of any size, weight or shape. On heavy work it is advantageous to remove the machine from the pedestal and use it as a portable tool as shown above.

Work in all cases is chucked to the bore and hubs need not be faced. The method of chucking is extremely simple, suitable stirrups and binders being furnished with each cutterbar outfit. Keyways cut on this machine come central with the bore and are ready for keys.

The machine is well built throughout, the first pinion and rack being of machinery steel and all gears have machine-cut teeth. Its efficiency, general usefulness and ease of operation will commend it to any one having keyways to cut.

Prices

Giant Power Hub Keyseater

No Facing of Hubs Required

To keyseat large pulleys no extension bars or outside supports are needed. As any piece requiring a keyseat is supported solely by its hub. A distinctive feature is the grooved post which holds the work and forms the guide for the tools. This enables you to obtain perfectly true, straight keyways, whether the hole is straight or taper or whether the hub is faced true, or left rough as it came from the foundry. Every job is quickly set and fastened by its bore only.

Nos. 2, 3 and 4 Are the Popular Sizes

In ordering or writing for prices, give diameter of holes, especially those sizes most used, length of hole of hub, especially the longest, width of keyseat, diameter of largest wheel to be keyseated.

Will the countershaft be overhead?

For shafting keyseaters, see next page.

No. 2 Keyseater and Countershaft

No. 00 Screw Machine

Capacity $\frac{1}{4}$ x 2-inch

A well built substantial machine of moderate size containing all the features of the large machines. Spindle hardened and ground. Solid steel turret rotator.

A. W. T. Co. collet No. 3 used. Suitable for the smallest size of rod work.

Lightness of working parts gives the requisite sensitiveness for small tools, making it a convenient machine for high grade work and large production.

Equipment: One $\frac{1}{8}$ No. 106 $\frac{1}{2}$ W collet; 2 tool posts; 4 tool post collars; 2 tool post blocks; 1 oil pot and cover; 1 stock feed collar; 2 wire guide bushings; 1 stop plug; 4 wrenches; 1 double friction countershaft.

Standard collet, No.	106 $\frac{1}{2}$ W
Price plain	\$285.00
Price plain with automatic collet	305.00

"Steno" 1" x 7" Turret Hand Screw Machine

Fitted with plain three-step, giving great power for all spindle speeds. Guard well covers the lower half of the cone, ties the front and rear bearings rigidly together and assists in maintaining the rigidity of the spindle.

The automatic chuck and bar feed, operated by the long lever at the left of the machine, grip the bar instantly and release completely. One movement opens the chuck and feeds the bar without stopping the machine. A stepped wedge, operating the fingers automatically, compensates for slightly varying diameters of stock.

Collets can be changed quickly by unscrewing collet hood. Collets and hood are hardened and ground to great accuracy. Chucks or fixtures for extra size pieces can readily be attached to spindle nose in place of collet hood.

All parts are made from jigs and fixtures and are carefully inspected and gauged before assembling, insuring interchangeability and close, accurate work.

Collets supplied from stock in the following sizes at extra cost: $\frac{3}{8}$, $\frac{7}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{8}$, $\frac{1}{4}$, $\frac{3}{16}$, $\frac{1}{8}$, $\frac{5}{16}$, 1-inch.

Hand Screw Machine No. 140

We can furnish this machine with six hole automatic turret or with four hole hand turret and with or without wire feed.

This little screw machine is made to stand the use of high speed tools, and the operation of turret and wire feed is so quick that much small work in moderate quantities can be done for less money by using cheaper labor than on an Automatic machine.

The head stock is cast solid with the bed, making as the cut shows a strong, rugged machine throughout.

The wire feed is the quickest to operate of any on the market. The movement of one lever does everything.

Turret has individual stops for each hole, and are on the front side where they are most convenient to adjust. A movable plug attached to the base is raised or lowered by a cam on the bottom of the revolving turret, so that even if the turret is revolved backward by hand there is no possibility of getting the wrong stop.

The cap on spindle can be taken off and chuck up to 8 inches in diameter, can be fitted for holding large work such as castings, etc.

Polishing and Finishing Lathe No. 113

For light work where pieces can be held in a spring or collet chuck. The chuck is opened by the foot lever which also shifts the belt to the loose pulley and applies a friction brake to stop machine immediately. When the foot lever is released a spring shifts belt back and closes chuck. The operator has both hands free.

The Lancaster 13-Inch Engine Lathe

Fitted with Four-Step Cone Pulley, Back Gears, Positive Geared Feed, Automatic Longitudinal and Power Cross Feed, Compound Rest and Chasing Dial

Three changes of feed are secured immediately by simply moving a handle to any one of the three locations

It is built large and heavy to withstand all strain placed on it by the use of high speed steel. It is powerful, accurate and durable—Manufactured to jigs and gauges and all parts are interchangeable. The lead screw is made of special high grade carbon steel. All sliding surfaces are accurately scraped to a bearing. The spindle and all round parts are ground for accuracy. The gears are easily changed for cutting different threads. It is indexed to cut standard threads from 4 to 40 either right or left, including 11½-inch pipe thread, and by compounding the gears furnished many other threads can be chased. It is equipped with plain or compound rest, follower and steady rests, change gears, large and small face plates, double friction countershaft and wrenches, and all gears are carefully guarded. The bed is rigid, cross ribbed by heavy boxed braces, cast in at frequent intervals its entire length, has three V's and one flat bar for the slot guide of the head and tail stock. The rack is steel and cut from a solid bar. The head stock is massive, having a bearing of 15¼ inches on the bed, the spindle is 60 point carbon crucible spindle steel accurately ground, having ¾-inch hole its entire length. The front bearing is 1¾ inches in diameter and 3¼ inches long. The spindle is bored to hold a No. 3 Morse taper. Bearings are high-grade phosphor bronze, carefully scraped to fit the spindle. The tail stock is offset to allow the compound rest to swing parallel to the bed, and is made of crucible steel. The carriage and apron are strong and with deep bridges each cast in one piece. The apron has a safety device, which prevents throwing in half nuts when either feed is connected, thus preventing breakage. The compound rest is graduated in degrees.

Swing over shear	13½ inches
Swing over compound rest	8 inches
Swing over carriage	9 inches
Distance between center—5-foot bed	30 inches
Front spindle bearing	1¾ in. in diam., 3¼ in. long
Rear spindle bearing	1½ in. in. diam., 2¾ in. long
Hole through spindle	¾ inch
Spindle nose	1½ in. in diam. (10 U.S.S. threads)
Tail spindle	1½ in. in diam. (5-in. traverse)
Taper of centers	No. 3 Morse
Threads per inch	4-80
Cone pulley diameters on lathe	7-5¼-4½-3¼ in.

Width of belt	2 inches
Ratio of back gearing	8½ to 1
Spindle speeds	16
Compound rest travel	4 inches
Length of carriage bearing on shears	15 inches
Cone pulley diam. on countershaft	8¼-7-5¼-4½ in.
Countershaft driving pulley	8x3¼ inches
Countershaft speed	150 R.P.M.
Lathe bed made in any length	
Size of tools	½ inch x 1½ inches
Weight five-foot bed	1000 lbs. on skids
Price	\$400.00

Screw Cutting Engine Lathes

No. 40—16-inch Lathe. Fitted with Automatic Longitudinal and Power Cross Feed Regular Equipment, as Illustrated under Lathe, is Included in Price

The following description applies to the No. 34, No. 37 and No. 40 lathes. The principal dimensions are shown in tabulated form below.

Bed is rigid, cross ribbed by heavy box braces cast in at short intervals its entire length; has three V's and one flat way for front bearings of head and tail stock. The rack is of steel, cut from the solid bar.

Head stock is equipped with improved reverse. Spindle is of special spindle steel accurately ground. Bearings are the best phosphor bronze with ample oiling facilities and adjustable for wear.

Tail stock is off-set to allow compound rest to swivel parallel to the bed and is provided with set over for turning taper. Tail stock center is self-ejecting.

Carriage and apron is strong with wide deep bridge; has T slots for clamping work for milling and boring. Both power cross and automatic longitudinal feeds are operated from front of apron and but one feed at a time can be engaged. Both feeds are driven by a splined screw and worm so that the thread of the lead screw is used for screw cutting only.

Thread cutting. Lathe is indexed to cut standard threads from 4 to 40, right or left including $1\frac{1}{2}$ pipe thread. Graduation. The compound rest is graduated in degrees. The cross feed screw has graduated micrometer collar reading in one thousandths of an inch.

Equipment as shown in cut includes a large and small face plate, compound rest, two steel centers, center rest, follow rest, change gears, gear guards, adjustable stop for screw cutting, necessary wrenches and double friction countershaft.

21-Inch Screw Cutting Engine Lathe

No. 47. 21-inch lathe. Fitted with automatic longitudinal and power cross feed.

Regular equipment, as illustrated under lathe, is included in price.

The following description applies to the No. 47, 21-inch and No. 54, 24-inch lathes. The principal dimensions are shown in tabulated form below.

Bed is rigid, cross ribbed by heavy box braces cast in at short intervals its entire length; has three V's and one flat way for front bearings of head and tail stock. The rack is of steel, cut from the solid bar.

Head Stock is equipped with improved reverse. Spindle is of special spindle steel accurately ground. Bearings are the best phosphor bronze with ample oiling facilities and adjustable for wear.

Tail Stock is off-set to allow compound rest to swivel parallel to the bed and is provided with set over for turning taper. Tail stock center is self-ejecting.

Carriage is strong with wide deep bridge; has T slots for clamping work for milling and boring. Both automatic cross feed and automatic longitudinal feed are operated from front of apron and but one feed at a time can be engaged. Both feeds are driven by a splined screw and worm so that the thread of the lead screw is used for screw cutting only.

Thread Cutting. Lathe is indexed to cut standard threads from 2 to 40, right or left, including 11½ pipe thread.

Graduation. The compound rest is graduated in degrees. The cross feed screw has graduated micrometer collar reading in one-thousandths of an inch.

Equipment as shown in cut is included in the price and consists of large and small face plates, compound rest, two steel centers, center rest, follower rest, change gears, adjustable stop for screw cutting, gear guards, necessary wrenches and double friction countershaft, also instruction book, How to Run a Lathe.

Barnes 14-24 Inch Sliding Extension Gap Lathe

Showing gap partially extended

A high quality, wide range lathe for garage and general repair shop work also a very convenient lathe for fitting and assembling work, in factory machine shops.

This lathe has the necessary strength and power to turn full diameter of swing in the gap, and at the same time it is free from any awkward or objectionable features for use when the gap is closed.

Details

Bed is very broad, deep and well braced, and it is accurately proportioned throughout. The top and main beds are planed full length and fitted together by dove-tail construction, which permits the top bed to be firmly held at any point by means of clamp bolts transversely placed through the main bed. For extending the gap, the top bed is drawn back by means of screw and crank at rear end. Rack and pinions are cut from steel, the rack being in one piece.

Head Stock is heavy and strong. The spindle is very large, accurately ground and runs in split bronze bearings. Cone pulley has four steps and is strongly back geared, giving eight changes of speed. A push pin on the head gear allows the cone to be instantly locked or unlocked without the use of a wrench.

Tail Stock is of the off-set type, allowing the compound rest to be set parallel with the bed, and has set over adjustment for taper work.

Carriage is extended in front and it is unusually strong to provide a firm support for the turning tool when doing

work in the gap up to the limit of its swing. The carriage is fitted to the bed with long bearing on the V in front and with flat bearing at the rear, and is fed by splined screw. It is thoroughly gibbed, and can be conveniently and quickly clamped to the bed for cross feed work. The carriage is also fitted with T slots for clamping on work.

Compound Rest has graduated base, is properly gibbed and has sufficient travel for the largest capacity of the lathe.

Feeds. This lathe has six Quick Change Geared Feeds, both longitudinal and cross. Feeds are as follows: .007, .011, .017, .019, .030 and .049 inches. Cuts either right or left hand threads consecutively from 2 to 18 including 11 1/2 pipe thread, by twos from 18 to 36, and by fours from 36 to 48.

Taper Attachment is secured to back of carriage and travels with it. Turns any taper up to two and three-fourths inches per foot. Swivel guide bar is graduated in inches, and is adjusted by means of hand screw.

No. 215 Countershaft Driven

There is no danger of getting caught, but covers for cone pulley on spindle and for motor on No. 211 lathe can be supplied if required.

Taper Bronze Ring Oiler Boxes are fitted to the head stock spindles. These will stand a speed of 4,000 R. P. M. without heating and can be adjusted for wear without affecting the fit or bearing on the spindle. Bearing surfaces are all hand scraped to an accurate fit to Brown & Sharpe standard surface plates and gauges.

Head Stock is Cast Solid with Bed.—This makes it stiffer and ensures a perfect and permanent alignment of the spindle and the ways.

Low Installation Cost.—The self contained underdrive lathes come to you all ready to run. No extra expense for hangers, shafting, belting, pulleys or couplings. They can be set in place and connected up in a few minutes.

Equipment Furnished.—1 rest holder. 1 6-inch screw chuck. 1 each cup and spur centers. 1 each 4 and 9-inch tee rests. Belt from motor or countershaft, shaft to spindle. Set of wrenches. Shelf on back of lathe if wanted. Any other equipment will be charged extra.

Before ordering always find out from your power company what current they will furnish you.				

No. 218 Demonstration Lathe

Idler Type with
Motor Underdrive

Made especially for a teacher's demonstration lathe, and in addition to the regular face plate and hand rest is equipped with a 11-inch outside face plate and 15-inch T rest, mounted on tripod stand for turning large pieces; also a hand feed carriage and swivel compound slide rest, invaluable for long straight turning and pattern making.

In general construction the lathe is the same as the No. 211, shown on previous page; and the dimensions are the same. The motor cover is optional; a cover for the cone pulley can be furnished if desired, and adds greatly to the appearance.

Can furnish with shaft underdrive, if desired.

No. 218. Wells' demonstration lathe, 5-foot bed, 36 inches between centers, 12-inch swing, complete as shown above without motor cover:

With $\frac{1}{2}$ H. P. 110 V Western Elec. D. C. Motor.....	\$212.50
With $\frac{1}{2}$ H. P. 220 V Western Elec. D. C. Motor.....	220.00

Motor cover, extra, \$3.20. Cone cover, extra, \$1.60.	

No. 100 Speed Lathes

These lathes are thoroughly made in every way, all the boxes and bearing surfaces are hand scraped to an accurate fit to Brown & Sharpe's standard surface plates and gauges.

Head Stock is cast solid with bed, making it stiffer and insuring a perfect and permanent alignment of spindle and ways.

Head Spindle is hollow and made from high carbon selected steel, ground accurately to size, and bored out true in its own boxes. The end thrust is taken up by means of a threaded nut at the back end of spindle.

Cone Pulley is turned both inside and out to insure perfect balance when running at high speed.

Boxes are larger and longer than ordinarily used on speed lathes and are lapped to a perfect bearing.

Tail Stock has both screw and lever feed or screw feed only as ordered.

Countershaft. All loose pulleys are made with a reservoir for oil sufficient to last for four weeks.

Equipment furnished consists of countershaft, 6-inch face plate, 2 point centers, one long and one short tee rest and table on back of lathe.

Distance between centers, 12"x3' $\frac{1}{2}$ '—12 inches, 11"x3' $\frac{1}{2}$ '—18 inches, 11"x4'—24 inches, 11"x5'—34 inches.

Foot Power Screw Cutting Lathe

No. 4 1/2 Screw Cutting Lathes

The smallest back geared screw cutting lathe we offer and the best lathe of its size on the market.

It swings 9 inches, 4 1/2 inches over the tool carriage, and takes 25 inches between centers, hole through spindle.

Small cone pulley, 2 1/2 inches; large, 4 1/2 inches. Weight, net 270 pounds; boxed for shipment, 340 pounds.

Price, with foot power or countershaft, \$100.00

Compound rest in place of plain rest, extra 10.00

Follow rest and hand rest extra, see next page.

Raising blocks to swing 15 inches (for turning and boring), extra 13.50

No. 5 Gap Lathe

The three lathes shown on this page are strictly high grade in design, material and workmanship.

They feed right or left and cut screws right or left without change of gearing.

The head stocks have steel spindles with holes through entire length. The boxes are accurately fitted to spindles with provision to keep them true and take up wear.

The tail stock can be readily set at any point, or taken off, leaving the table bed free for face plate or chuck work. The spindles of head and tail stocks are of steel, with true taper holes to receive centers, and the tail stock center is self-discharging.

The tool carriage is a model of convenience and accuracy and is gibbed to the bed.

These lathes are made with automatic cross feed which has no special advantage on a small lathe with less than 13-inch swing. The tool carriage swivels to set tool at any angle and adapting the lathe for taper boring, a feature of greater value than automatic cross feed.

All working parts are protected from chips and dirt, insuring great durability.

The No. 4 1/2 lathe is indexed from 5 to 40, and both No. 5 lathes from 4 to 40 threads and the change of gears furnished can be combined for many other threads.

All gears are accurately machine cut, are true and as noiseless as is possible with metal gearing.

Furnished with foot power or countershaft in each case. If foot power, state whether velocipede or standup treadle is wanted.

No. 5 Screw Cutting Lathes

A Perfect Tool for Right or Left Hand Cutting

Swings 11 inches on face plate, 6 3/4 inches over tool, and is 34 inches between centers. Weight boxed for shipment, 500 pounds.

Price with foot power or countershaft \$134.00

Compound rest in place of plain rest, extra 13.50

Extra for hand rest and follower, see next page.

For gunsmiths and other work requiring longer centers we furnish with bed for 40-inch centers at an extra charge of \$6.75

No. 5 Gap Lathe

Made in one size and style only. It is equipped with the same head stock and gearing as regular No. 5 lathe, and extras, such as lathe tools, centers, drill pads, etc., are used on either lathe.

Swing over bed, inches 11

Swing over tool carriage, inches 6 3/4

Swing in gap, inches 15

Width of gap (from face-plate), inches 5

Distance between centers, inches 29

Hole through spindle, diameter, inch 1 1/2

Net weight, pounds 500

Weight (boxed for shipment), pounds 650

Price complete with foot power or countershaft \$167.00

Bench Lathes

Some customers prefer the lathes mounted on bench legs for various reasons, and we offer the smaller sizes thus mounted. We are prepared to furnish the $4\frac{1}{2}$ and 5 lathes on bench legs as follows:

	With Countershaft	Without Countershaft
No. $4\frac{1}{2}$ bench lathe.....	\$100.00	\$ 87.00
No. 5 bench lathe, regular length bed.....	134.00	120.00
No. 5 bench lathe, extra length bed.....	140.00	127.00

Follow Rest

Hand Rest

The lathes Nos. $4\frac{1}{2}$ and 5 are built for metal turning, but can be speeded high enough so that wood turning can be done to very good advantage.

For wood turning a hand rest is required, the price of this rest for No. $4\frac{1}{2}$ lathe being \$3.00; for No. 5 lathe, \$4.00.

Follower Rest

The cut shows a follower rest, which we can furnish, the price being for No. $4\frac{1}{2}$ lathe, \$3.00; for No. 5 lathe, \$4.00.

Hand Rest

Friction Clutch Countershaft for Nos. $4\frac{1}{2}$ and 5 Screw Cutting and No. 5 Gap Lathe, Except that Cone Has Three Steps Only.

The pulleys on countershaft are 7x2 inches and should be speeded 225 revolutions.

Price of countershaft.....

\$20.00

Polishing Lathe No. 29

Polishing lathe, complete with tail stock, tee rest, face plate, saw arbor, and three-jawed chuck, capacity 0 to $\frac{3}{8}$ -inch. Bed is milled. Spindle is hollow. The bed is 12 inches long and swings 5 inches with $3\frac{1}{2}$ inches extreme distance between centers. Pulley steps $\frac{3}{4}$ -inch wide and 1 $\frac{1}{2}$ -inch and 1-inch in diameter; the large step is grooved for round belt. Gross weight, 14 pounds. Net weight, 10 pounds.

Price each.....\$8.50

Polishing Lathe No. 29½

This polishing lathe is provided with a screw tail stock and a taper hole in both ends of the live spindle, and also provided with a special spindle for carrying buff wheels. Furnished complete with tail stock, tee rest, face plate, saw arbor, taper threaded polishing spindle, and three-jawed chuck, capacity 0 to $\frac{3}{8}$ -inch. Gross weight, 14 pounds. Net weight 10 pounds.

Price each.....\$11.00

Amateur Bench Lathe No. 125

This lathe will handle a wide range of work, making it applicable for use in laboratories, repair shops and trade schools. It has a milled bed; a hollow spindle provided with a Morse taper with a $\frac{3}{8}$ -inch hole clear through. Has both screw and socket, with a $\frac{3}{8}$ -inch hole clear through. Has both screw and lever feed in tail stock. Total length is 25 inches, with an extreme distance of 12 inches between centers. Swing, 7 inches. Diameter of pulley steps, 1½, 2½, and 3½ inches. Furnished complete with tee rest, slotted face plate, saw arbor, and three-jawed chuck, with capacity of 0 to $\frac{1}{4}$ -inch. Gross weight, 42 pounds. Net weight, 30 pounds.

Price each.....\$24.00

Polishing Head No. 21

No. 21 polishing head has a solid iron frame 6 inches in height; steel spindle $\frac{3}{8}$ inch in diameter and 8 inches long. Japan finish. Distance between flanges $\frac{3}{4}$ inch. The pulley is 1½ inches in diameter and grooved for $\frac{3}{4}$ -inch round belt; $\frac{3}{4}$ -inch face. Weight 2½ pounds.

Price each.....\$1.70

Polishing Head No. 22

No. 22 polishing head is 6¼ inches in height and is fitted with a $\frac{1}{2}$ -inch spindle, 10 inches in length. Distance between flanges, $\frac{3}{4}$ -inch. Pulley is 2¼ inches in diameter; $\frac{3}{4}$ -inch face and is grooved to take a $\frac{3}{4}$ -inch round belt. Weight 4 pounds.

Price each.....\$2.80

Bench Grinder with Lathe Attachment No. 306

The bed of this lathe is 18 inches long, it will swing in the extreme 5 inches, and a piece 12 inches long can be held between the centers. It is furnished complete as shown in cut; the foot power attachment is adjustable for benches of various heights. Equipped with one Alundum wheel, 4 inches in diameter, 1 inch face. Packed one in a box.

Price each.....\$9.00

Slide Rest No. 132

Slide rest for use with No. 125 bench lathe. It has a longitudinal motion of 3¾ inches, and a cross motion of 2¼ inches. It is made to hold lathe tools $\frac{3}{4}$ x $\frac{1}{4}$, and weighs, net, 6½ pounds. Shipping weight, 11 pounds.

Price each.....\$14.40

Lathe Tools No. 126

For use with No. 132 Slide Rest. Size $\frac{1}{4}$ x $\frac{1}{4}$ inch.

Price per set.....\$7.20
Price each......70

"Chicago" Column Grinder

A stiff and substantial grinder for grinding and polishing in the machine shop, foundry, blacksmith shop, garage, etc., carries wheels up to 24x3 inches or smaller with 1 1/4-inch hole.

Has special long spindles and bearings. The bearings have unusually large space for the operator and for grinding large and irregular shaped castings. It is designed to grind or polish both large and small work, as well as bicycle and automobile work.

The bearings are adjustable and babbitted with genuine babbitt and are well provided with oilers. Each bearing has four bolts, holding them in a true line.

Supplied with rests to stand heavy work and can easily be arranged for the side or face of the wheel.

Capacity 18 inches by 3 inches, wheel with 1 1/4-inch hole, arbor to floor 34 inches, diameter of base 18 inches, length of arbor 40 inches, diameter of arbor 1 1/4 inches, size of pulleys 1 1/4 inches by 4 3/4 inches, weight complete 235 pounds.

Price.....\$25.00
Countershaft for above 16-inch drive pulley, 6-inch tight and loose pulleys, weight 85 pounds. Price.....14.00

A price in line saves time.

St. Louis Grinding Machines

With Self Contained Countershaft

Front View

Rear View

These are very heavy high-grade machines, with .40 point carbon arbors, self-oiling, dust-proof bearings, and embodying a high-grade workmanship and finish throughout.

The self-contained countershaft affords several advantages over the detached type. The most apparent is the saving in erection, as it takes less belting and saves the labor of attaching the countershaft to the ceiling. It permits setting the machines under the line-shaft and away from the higher priced machines.

The belt tightening device will keep the belt at proper tension until worn out. It consists of the countershaft frame attached to the column by square gibs and adjusted by screw, as shown.

St. Louis Grinding Machines—Continued

St. Louis Grinders with tight and loose pulley made in all sizes.

21, 22, 23 and 24 Machines.

Description of Parts

The illustration shows the type of bearing used on all St. Louis grinding and polishing machines. The body of machine is milled with a recess. The cap is milled with a corresponding tang, which fits into the recess, taking all side strain off screws, making rigid, dust-proof bearing.

Tang on cap is milled longer than depth of recess. As bearing wears, this tang can be dressed down, thus eliminating the necessity of liners.

These bearings are reamed on solid reamer bars between centers, the caps being brought down metal to metal. This insures an equal bearing full length of the box.

This cut illustrates a tight and loose pulley of most approved design. The hub of loose pulley is 2-inches longer than the face of pulley, projecting equally on each side. This gives an extra long bearing and corresponding durability.

There is an ample oil chamber in the center, in which is placed a soft absorbent felt, producing a very effective self-oiling feature.

Bearings

T. & L. Pulleys

A recess is bored into the hub of the tight pulley, into which the loose pulley hub projects, which fully protects the bearing from dust. On the self-contained machine the countershaft bearing is also chambered.

This pulley is used on both St. Louis and Western Countershafts.

Cut to the right illustrates the most effective open type guard that has ever been produced. It consists of a steel channel rolled to a segment of a circle. This is very stiff and unbreakable, and is further reinforced by a heavy cast iron bracket riveted to the inside flange of the channel.

This bracket is attached to the back rest shown on the machine by a bolt which slides in the slot, allowing the guard to be adjusted backward as the wheel wears. The lips of the guard can be kept close to the wheel, where they are not in the operator's way, and eliminates danger of dropping material between wheel and guard.

This guard effectively prevents fragments from striking the operator, and if the wheel should break would strike inside the flanges of the channel and be prevented from flying.

The cut herewith shows a Surface Grinding Attachment, for use on Nos. 3 and 4 St. Louis Grinders.

It attaches to back rest in place of Wheel Guard at left end, or to front rest in place of rest arm at right end. It can be removed very quickly.

It has fine adjustment with hand wheel and screw.

With Arbor Core
Open Type Wheel Guard

The arbor cover does not come with the guard unless ordered at a small additional price.

Surface Attachment

Western Grinding Machines

Nos. 1, 2, 3

No. 4

On this and the following page we illustrate our line of Western grinding machines.

While moderate in price, and comparing very favorably with other machines of their class in specifications, they contain several improved features.

Machines are well painted with oil-proof paint.

Nos. 1, 2 and 3 machines are fitted with back rest to receive wheel guards. The No. 4 rest bracket, which is furnished as an extra, is arranged to receive wheel guards for this machine.

The No. 4 head is not sold separate from the column.

The No. 4 machine is quoted regularly without rests, which can be furnished as an extra. The illustration shows one end with rest and wheel guard, the other without.

Universal Grinder No. 190

The only low-priced tool grinder having Swivel Table with vertical adjustment so that Cup Wheels can be used as easily as any other form.

Description

Back Feed for longitudinal movement of table (or slide) gives a steady, even feed.

Table revolves entirely around the Head, enabling the work to be presented at any angle to the wheel.

Slides have both Horizontal and Transverse movement and the top slide swivels for grinding taper work.

Hand Wheel shown on side of base raises and lowers table.

Swivel Boxes ensure perfect alignment of spindle bearings essential to a grinding machine.

For about all the requirements for tool sharpening and grinding in the average shop these grinders are large enough and rigid enough.

Why pay big money for extra capacity which you do not need and would never use!

Accuracy

All parts are made and fitted with the same degree of care and accuracy as is applied to the larger and more expensive grinding machines.

Above Illustration shows "No. 190 Complete Universal Grinder with all Attachments"

The **Spindle** is ground and thoroughly protected by dust-caps. All slides are hand-scraped to an accurate fit. All **Slides** are fitted with gibs for taking up the wear, and the spindle has a spring take-up for taking up the end-thrust.

General Dimensions of Nos. 184 to 190 "Wells" Grinders

Swings 8 inches diameter on centers.	Transverse movement of table, 5 1/4 inches.	Measurements, boxed, 55 x 28 x 28 inches.
Distance between centers, 16 inches.	Vertical movement of table, 6 inches.	Speed of countershaft, 700 R.P.M.
Longitudinal movement of table, 16 1/2 inches.	Speed of main spindle, 3780 R.P.M.	Length of table, 26 inches.
		Floor space required, 50-inch circle.

"Wells" Cutter and Reamer Grinders are regularly furnished with different combinations of equipment, as noted below:

No. 184

Plain countershaft.
Head and tail centers.
Universal tooth rest.
Hand rest.
Bevel mill holder.
Split arbor for 1-inch hole.
Adjustable stops for long slide.
Clamps for top slide.
Net weight, 360 lbs.
Boxed for export, 480 lbs.
Price, \$115.

No. 185

No. 184 equipment.
Formed cutter attachment.
Price, \$121.

No. 186

No. 184 equipment.
Circular grinding attachment.
Double countershaft.
Price, \$135.

No. 187

No. 184 equipment.
Formed cutter attachment.
Circular grinding attachment.
Double countershaft.
Price, \$141.

No. 188

No. 184 equipment.
Formed cutter attachment.
Taper shank and mill holder.
Universal vise.
Price, \$151.

No. 189

No. 184 equipment.
Formed cutter attachment.
Circular grinding attachment.
Double countershaft.
Taper shank end mill holder.
Universal vise.
Price, \$171.

No. 190

Complete Universal Grinder

Double countershaft.
Head and tail centers.
Universal tooth rest.
Hand rest.
Bevel mill holder.
Split arbor for 1-inch holder.
Formed cutter attachment.
Adjustable stop for long slide.
Clamps for top slide.
Three indexes for formed cutters.
Three Dogs, 1/2 inch, 3/4 inch and 1 inch.
Circular grinding attachment.
Taper shank end mill holder.
Universal vise.
Internal grinding attachment.
3-inch chuck.
Fifteen emery wheels.
Weight, 480 lbs.
Boxed for export, 620 lbs.
Price, \$200.

Style W. P. L. Overhead Countershaft

When a drill is ground by the "New Yankee" drill grinder its point is accurately centered. Each lip is ground at the same angle, the same length and at the same clearance. Each cuts the same amount and the holes are round and accurate to size.

The only drill grinder which does not require a series of time consuming adjustments for each size of drill. No caliper of drills and no adjustments are necessary except that of the tail stock for length of drill.

All New Yankee drill grinders are equipped with high grade adjustable bronze bearings.

Specifications

Style	W. P. L.	A	D
Capacity, diameter of drill, inches	No. 60 to 2½	¾ to 2½	¾ to 2½
Diameter emery wheel, inches	9½	9½	9½

Cubic feet, boxed	17	12	14

Style A
Countershaft in Base

Style B. Motor-Driven

Style W. P. L.	Price	\$214.00
Style W. P. L. Same as style W. P. L., except cap. ¾ to 2½-in. drills.	Price	217.00
Style A.	Price	113.50
Style J. A. Same as style A, except capacity ¾ to 1¼-in. drills.	Price	110.00
Style D. With 110 or 220 D. C. motor.	Price	233.50
Style J. D. Same as style D, except capacity ¾ to 1¼-in. drills.	Price	230.00
Style L. D. Same as style D, except capacity No. 60 to ¾-in. drills.	Price	240.00
Point thinning attachment will be furnished with Styles A. and J. A. grinders for \$5.50 extra, and for Styles D., J. D. and L. D. for \$10.50 extra.		
We can also furnish the New Yankee drill grinders on bench bases with overhead countershafts as follows:		
Style M. Single end type for ¾ to 2½-inch drills.	Price	\$99.50
Style K. Double end type for ¾ to 1¼-inch drills.	Price	87.00
Style L. Double end type for No. 60 to ¾-inch drills.	Price	84.00
Point thinning attachment for Styles M. & K., \$4.00 extra; Style L., \$2.75 extra.		

Point Thinning Attachment

An extended spindle, point thinning wheel, tool rest, etc., for thinning the points of drills. It can be furnished on any single end machine. The trifling additional cost makes it a profitable investment. The size of wheels are as follows: 12x5½-inch with 12-inch drill wheel, 10x1½-inch with 9½-inch, 7x5½-inch with 7-inch, and 5x1½-inch with 5-inch. A 10x1-inch or 7x¾-inch plain tool grinding wheel can be furnished instead, for use with their respective sized drill wheels, when desired, at the additional price named above.

No matter what your conditions may be, there is a New Yankee grinder to suit them.

Motor Driven Dry Grinding Machines

For Direct Current

These machines are of massive construction and of sufficient floor area to keep the motor from vibrating when the grinding wheels get out of true.

Safety shape wheels and flanges can be used.

Arbor is of high grade carbon steel, accurately ground and runs in ring oiling, dust proof bearings.

Motors are totally enclosed and ratings are based on intermittent duty. All motor parts are furnished by the General Electric Co.

Direct current motors can be furnished with patent speed controller by which a 75 to 100 per cent speed variation is obtained by means of external field control, and a constant periphery speed maintained until the wheel is practically worn out. If one wheel wears down faster than the other the speed is regulated by the larger. **It is impossible to speed the wheels too fast.**

Only certain fixed speed can be gotten with alternating current motors for grinding machinery, and we have adopted such sizes of wheels as can be operated economically at the speeds indicated for each machine.

Starting box, switch and non-arcing fuses are placed inside the frame on a slate panel.

14-inch Disc Grinding Machine
Motor Driven

Spindle is of high grade steel, babbit bearings with compression grease cups.

The lever feed table shown at right can be adjusted to any angle up to 45 degrees to disc. Oscillates forward and backward. Has a vertical adjustment of 4 ½ inches, two T slots and an adjustable stop graduated in thousandths of an inch.

Price as shown above with 5 H. P. motor, 1200 r. p. m. plain cementing clamp, two steel discs and supplies, D. C. motor.....\$894.00

A. C. motor, 60 cycle, 2 or 3 phase.....\$734.00

With lever feed table both ends, no plain table, add.....\$107.00

With plain table both ends, no lever feed table, deduct.....\$107.00

14-inch Disc Grinding Machine
Belt Driven

All wearing surfaces exposed to grit are protected. Base is provided with door for tools, etc. Discs are of steel turned true to .001-inch.

Counter shaft has self oiling hangers and loose pulley.

Price as shown above, with plain cementing clamps, countershaft, two steel discs and supplies.....\$300.00

With lever feed table one end as shown in left hand cut, add.....\$50.00

With lever feed table both ends, add.....\$160.00

Universal Clamps

These are furnished in 18-inch and larger sizes only, and are provided with a lifting device that enables one man to do all the work.

Size of clamp, ins. 18 20 23

Price.....\$67.00 \$67.00 \$94.00

Size of clamp, ins. 27 30

Price.....\$117.00 \$154.00

Plain Clamps

Plain clamps same as above, only no lifting device and no yoke over bend, but with top part arranged to lift off by hand.

Size of clamp, ins. 14 18 20

Price.....\$27.00 \$40.00 \$40.00

Size, inches. 20 23 27 30

Price.....\$20.00 \$33.40 \$46.70 \$60.00

St. Louis Polishing Machines

These machines are the same high-grade design, workmanship, and finish as the St. Louis grinders, have the same type of bearing, and are designed to be the most efficient babbitt-bearing machine possible to build. We are also prepared to furnish Randall graphite, bronze or cast iron shell bearings.

These machines are adapted to belt from overhead, from a shaft on the floor at the back, or from beneath the floor.

The Nos. 7 and 8 machines are floor machines of the most substantial character.

Specifications

"Marvel" Draw-Cut Hack Saw Machines

No. 1 Machine

No. 2 Machine

Saws straight and fast—prevents breaking of blades and is instantly adjustable. The saving in time and blades thus effected soon repays cost of the machine

The No. 1 has a draw cut; a quick action vise that saves time; a device that raises or lowers saw and holds it at any desired angle allowing free use of both hands in measuring material. It saws close to vise, has an extension to table so material rests on both sides of saw. The wear can be taken up to any extent in the two saw bearings, which have also receptacles for oily waste. Drive shaft has bronze bearing. Starter and automatic stop are at front of machine.

The No. 2 is heavy and exceptionally rigid in construction. Feed lever at top carries tension thumb screw. The same lever raises or lowers saw and holds it in any position, a great convenience in measuring. The quick action, heavy vise swivels both ways so that material can be inserted to cut on an angle either way. The wear can be taken up to any extent in the two saw bearings, which have also receptacles for oily waste. The drive shaft has bronze bearing. Starter and automatic stop are at front of machine. Has adjustable stroke, longest 6 1/2 inches, shortest 4 inches. The entire vise can be instantly removed (leaving a T-slotted table for holding irregular shapes) and makes an excellent tool for clamping work on drill press, etc.

Number	Capacity inches	Length of Blade	Speed R. P. M.	Size of Pulley, inches	Size of Belt, inches	Shipping weight	Price
No. 1	4x4	12 in.	60 to 90	13x2 3/4	2 1/2	120	\$33.50
No. 2 with swivel vise	6x6 long stroke 8x8 short stroke	12 to 17 in.	50 to 70	17x3 1/4	3	285	70.00

No. 30 Steel Traveling Stand for Nos. 1 and 2, weight 25 lbs. Extra \$3.25.

The "Marvel" High Speed Saw No. 4.

Great cutting speed, accuracy and high grade, reliable workmanship are embodied in this machine. It cuts down the cost of cutting to such a degree that users will find it the most valuable addition to their equipment.

Repeated tests of the cutting speed under extreme feed pressure show the following results: 6-in. Round Cold Rolled Steel 10 minutes; 5-in. Round Cold Rolled Steel, 8 minutes. Smaller sizes in proportion.

The saw cuts on the **draw stroke** and lifts free of the cut on the return.

Any desired pressure on saw blade during cutting stroke may be obtained by means of graduated feed wheel on side near top of machine.

The entire blade can be used up by shifting the saw frame by means of a right and left screw on the connecting rod while running.

The saw frame always moves in a horizontal position, is actuated by a crank lever which imparts a smooth, even cutting stroke to the saw blade, and gives a quick return.

Both ends of saw frame are fitted with fastener for blade so arranged that blade can be tilted to right or left at either end.

The stroke can be changed from four to six and one-half inches by means of shifting bolt in the crank.

The vise has liberal dimensions with jaws which extend out flush with saw blade. It can also be shifted forward or back and will **swivel to either right or left** for cutting on an angle.

Machine stops automatically when piece is cut off and can also be set to stop at any desired depth in the cut.

This machine is provided with reliable plunger pump with ball valves and overflow tank which gives a steady stream of compound on the saw blade. It can also be shifted forward or back and will swivel to either right or left for cutting on an angle. Pump and all connections may be removed in five minutes by removal of the two cap screws in outer wall of large tank.

Capacity 6 in. by 6 in. Takes 3-inch belt. Speed, 135 R. P. M. for varied carbon steel (using short stroke on high carbon), 145 R. P. M. when all cutting is low carbon. Size of Pulley, 16x3 1/4 inches. Net weight, 475 lbs. Weight, crated, 540 lbs. Price \$260.00.

"Q and C" Shop Saws

The machines are started by a clutch on the driving shaft, thus rendering a counter-shaft unnecessary. A handle can be attached to the pulleys so that it may be run by hand, if desired. It is provided with double saw guides, and will cut perfectly square if properly handled. All rods, guides and shafts are steel, and the machine is well and substantially built.

No. 4, Swivel-Vise and Power Feed

No. 3, Gravity Feed

On Numbers 1 and 3 the ratchet feed has been eliminated and the saws are now furnished with gravity feed only—as better and more accurate cutting can be done with the gravity feed alone.

Number	Cutting Capacity Inches	Size of Saw Blade Inches	Stroke of Blade Inches	Size of Pulleys Inches	Speed R. P. M.	Floor Space Inches	Shipping Weight Lbs.	Price including six blades
No. 1.....	4x4	12x $\frac{1}{2}$	6	14x2 $\frac{1}{2}$	50	18x30	160	\$ 37.00
No. 2—Swivel Vise.....	5x6	14x $\frac{3}{4}$	6	14x2 $\frac{1}{2}$	50	18x30	225	52.00
No. 4—Swivel Vise.....	7x8	17x1	6	14x3	50	12x32	335	105.00

"Kwik-Kut" Power Hack Saw Machines

Patented construction—utilizing practically full length of blade at each stroke. Length of stroke is automatically regulated by the size of the stock held in the vise.

Using the full cutting length of the blade at each stroke, instead of 6 inches or less, effects a great saving in blades, which is further increased by employing a simple device by which the blade is slightly raised on the return stroke.

The No. 7 machine has lubricating system to avoid burning the blade—consisting of pump, tank, piping and catch basin to avoid loss of cutting compound.

No. 7 has two speed cone pulleys for a minimum of 50 strokes per minute for cutting hard tool steel and for a high speed of 80 strokes for large sizes of iron and soft steel. Solid vise is furnished unless otherwise specified, though a swivel vise may be had at the same price.

Driving mechanism—a beveled rim friction wheel fastened to the shaft so that when the rod is pulled to start machine it forces the pulley against this wheel, furnishing a durable and reliable driving power.

The No. 14 machine embodies the features of the No. 7 except that it is a dry-cutting machine and is not furnished with lubricating system. No. 12 is also a dry-cut machine, similar to No. 14, except that it does not have the patented saw guide.

No. 7. The Popular High Speed Machine

Number	Capacity on Straight Cut Inches	Capacity at 45 Degrees Inches	Length of Blade Inches	Strokes per Minute	Size of Pulley Inches	Height Floor to Vise Inches	Floor Space Inches	Approx. Shipping Weight	Price Each
7	See Note below	See Note below	18	80 or 50	18 or 20x3	23	18x40	600 lbs.	\$170.00
12	6x6	See Note below	14	50	16x3	22	17x37	400 lbs.	100.00
14	4x4	4x2 $\frac{1}{2}$	12	70	16x3	23	13x36	280 lbs.	70.00

Capacity of solid vise for No. 7 is 8" for round stock and 7"x8" for square edge stock and the swivel vise with guide capacity is 7"x7" straight or 4 $\frac{1}{2}$ "x8" at 45° or takes 8" round by removing guide, changing jaws and shortening reach rod. Capacity of No. 14 is swivel vise at 90° 5"x6", at 45° is 3 $\frac{1}{2}$ "x6". For ordinary cutting use 18x1-16 Ga. blades, 10 teeth per inch, for pipe and tubing use 12 teeth per inch.

If you cannot find exactly what you require in this Catalog, write us.

Sterling Power Hack-Saw Machines

Nos. 1A and 2A

Machine No. 1A

Length of blades, 10 inches to 12 inches. Stroke 6 inches. Cutting capacity, 5 by 5 inches. Tight and loose pulleys, 10 inches in diameter, 1 1/4-inch face. Geared 3 to 1. Swivel vise adjustable to 45 degrees angle. Vise jaws, 2 3/4 inches high, 4 1/2 inches wide, 6-inch opening. Floor space, 17 by 30 inches. Net weight, 150 pounds. Crated 200 pounds. Knocked down and boxed, 250 pounds.

Half-dozen 12-inch by 5/8-inch blades free with each machine.

Price Machine No. 1A, complete.....\$60.00

Machine No. 1, as above, but without automatic lift.

Price.....\$50.00

Machine No. 2A

Length of blade, 12 by 14 inches. Stroke, 6 inches. Cutting capacity, 5 by 5 inches. Tight and loose pulleys, 10 inches diameter, 2 1/4-inch face. Geared 3 to 1. Swivel vise adjustable to 45 degrees angle. Vise jaws, 3 1/2 inches high, 4 1/2 inches wide, 6 1/2-inch opening. Floor space, 17 by 30 inches. Net weight, 155 pounds. Crated, 200 pounds. Knocked down and boxed, 250 pounds.

Half-dozen 14-inch by 3/4-inch blades free with each machine. Fourteen-inch blades measure 13 1/2 inches between center of holes.

Price Machine No. 2A, complete.....\$63.00

Machine No. 2, as above, but without automatic lift.

Price.....\$57.00

Sterling High Speed Machines

The Sterling High-Speed Machine can safely be run at 100 strokes per minute with lubricant, or at an even higher speed if necessary. Front cabinet leg is a tank to which pump can be attached for supplying lubricant to keep blade cool when running at high speed. The adjustable frame permits of using any length of blade from 17 to 21 inches, inclusive. The gears are milled, being of wide face and strong to stand hard wear. The bearings are large and heavy, specially made to stand the strain entailed by running at high speed. Gear bearings are adjustable so that when parts wear the lost motion can be taken up. Has swivel vise cutting any length to 45 degrees angle, also gravity feed and automatic shut-off. Automatic lift which is an important feature lifts blade on return stroke. Cam is constructed so that blade of saw is gradually placed in contact with work on cutting stroke, minimizing breakage of blades and also increasing efficiency.

Machine No. 3A

Length of blades, 17 to 21 inches. Stroke, 6 inches. Cutting capacity, 8 by 12 inches. Tight and loose pulleys, 10-inch diameter, 2 1/4-inch face. Geared 2 1/2 to 1. Swivel vise adjustable to 45 degrees angle. Vise jaws, 4 3/4 inches high, 5 1/4 inches wide, 12-inch opening. Bed of machine, 2 feet from floor. Floor space, 18 by 44 inches. Weights, net 520 lbs.; crated, 600 lbs.; knocked down and boxed, 750 lbs.

One-third dozen 17-inch blades free with each machine. 17-inch blade measures 16 1/2 inches between center of holes.

Price Machine No. 3A, complete.....\$195.00

Machine No. 3, without automatic lift. Price.....175.00

Duplicate parts should be ordered from number on casting.

Sterling High-Speed Machines, if desired, may be equipped with electric motors, either direct or alternating current.

No better hack-saw blades are made than "Sterling." That is why we sell them.

"Racine" High Speed Metal Cutting Machines

Fig. G. No. 1 Machine. Capacity 6x6 Inches

The Racine is the original, automatic, positive lift machine with the draw cut. This is accomplished by using a patented, return stroke, automatic lifting device (no dragging back) and thereby increasing the output and endurance of the blade.

Machine cuts rapidly, truly and economically. The No. 1 will cut a 6-inch bar of machinery steel in 28 minutes.

Blade holders are made from flat bar fitted into a milled slot which holds the blade square with the work, and the blade tightener enables the operator to give the blade sufficient tension without the use of a wrench.

The saw frame holds itself automatically at any height and is adjustable to take up wear.

Machine stops automatically when through cut. Depth and length gauge and geared circulating pump furnished. Pump applies a cooling compound on the blade.

Size No.	Description	Capacity, Inches	Standard Machine		With 3-speed Attach.		With Electric Motor	
			Weight, Pounds	Price	Weight, Pounds	Price	Weight, Pounds	Price
1	Regular High Speed	6x 6	400	\$ 93.75	500	\$137.50	550	\$181.25
10	Regular High Speed	8x 8	550	137.50	650	187.50	700	237.50
7	Heavy Duty	12x12	800	218.75	900	281.25	950	325.00
9	Heavy Duty	12x15	850	250.00	950	312.50	1000	356.25

Price with motor does not include single phase A. C. current. Machines can be furnished with both 3 speed attachment and motor drive at extra cost. Three speed transmission (three machines in one), enables you to cut annealed high speed steel, unannealed tool steel and all mild or soft steel at the proper speed.

Clem Tilting Metal Band Saw

Economical. Rapid. Accurate.

Simple in Adjustments. Easy to Operate.

The thin blade removes only $\frac{1}{8}$ -inch of metal, and while the points of carbon affects its speed it cuts an average of 1 inch of area per minute.

It consumes from $\frac{1}{4}$ to $\frac{1}{2}$ horse power. Size of table 45x17 inches.

It will cut up to 12-inch round and will cut squares, flats, pipes, tubing, angles, beams, rails, etc., to any mitre or angle. It will split collars, bushings, bearings, etc., and will give perfect satisfaction. No cutting fluids—no special operator.

Easy adjustments for raising and lowering head, tightening bands and controlling tilting head. Balance weights adjust themselves to the carbon of steel and condition of saw band.

The operation is simple. Clamp steel up against the back plate—start the machine—pull the head forward until the band rests against the steel and the saw does the rest.

Price of saw for belt drive as shown on left, including 6 bands of any tooth desired, crated for shipment. \$225.00

Price of saw with motor attached, starter and six bands, crated for shipment. \$300.00

No. 2 Cold Saw

The No. 2 Cold Saw. The saw is 14 inches in diameter and will cut stock 5 inches round, 4 inches square, and flats up to 3x8 inches.

The feed is positive through a screw operated by a ratchet and double pawls one or both of which are used. The travel of the pawls is easily regulated and the feed is readily engaged or disengaged.

The No. 3 Cold Saw. The saw is 16 inches in diameter and cuts up to 6 inches round, 5½ inches square and 4x10-inch flats. The feed is of the friction type, simple and effective, giving a complete range by simply changing the position of friction roller.

A grinding device as shown below is furnished with each machine. This is designed to operate on a bench and is provided with adjustable in and out stop and adjustable tooth gauge. It will both gum and back off the teeth, two emery wheels being supplied.

Grinding Device

Metal Cold Saws

These are high class tools, strong, serviceable and efficient. The saw blades have constant relief from rim to center and may be ground as much as is profitable.

The saw arbors are driven by a shaft parallel to the bed. Through a steel worm, having a ball thrust bearing, a worm gear with bronze rim, and machinery steel spur gears, forming a powerful and substantial mechanism.

The No. 1 Cold Saw has a saw 10 inches diameter and will cut stock of any shape up to 3½ inches round. The feed is by gravity, the carriage being advanced by chain running over a sheave and connected to the lever, which has an adjustable weight which is moved out as the saw becomes dull, or to adapt the feed to different stock. This gravity feed is safer and better than a friction feed, in every way.

No. 1 Cold Saw

We can apply Motors to all Saws.

No. 7 "Q and C" Portable Rail Saw

Designed for cutting off rails at any angle with their length. The saw blade commences cutting in the center of the head of the rail, and will make a true vertical cut at whatever angle desired, leaving the ends of the rail perfectly smooth and straight.

This saw has sufficient capacity for cutting all steam rails up to 135 pounds per yard and will cut all rails up to a 7-inch girder rail in track, and higher rails out of track, by reversing rail after half of cut is made.

The reducing gear is arranged on the slide supporting the saw blade and a simple form of automatic feed lowers the saw at the proper speed for cutting the head or base of the rail. This is accomplished by means of a friction nut, located on the feed screw, which can be quickly released to feed the saw by hand through the web of the rail, or in the return of the slide, by means of the feed screw crank.

A pawl prevents the saw blade from being turned backwards, which must never be done while cutting.

The saw blade is 18 inches in diameter, $\frac{3}{8}$ -inch thick. Maximum depth of cut is $7\frac{3}{4}$ inches.

Special high speed steel blades furnished at extra charge.

Dimensions, 19x30x32 inches. Gross weight, 375 pounds. Net weight, 300 pounds. Price.....\$250.00

Price includes two saw blades and necessary wrenches.

Saw grinder—for sharpening the blades—can be attached to a bench in the shop and belted to run about 1200 R. P. M. Price of grinder.....\$30.00

Cold Metal Sawing Machine

Style No. 1 M

A Small but Powerful Saw With Large Capacity

The saw blade is driven from the periphery, steel rollers being used. These rollers are hardened and ground and journaled in removable steel bushings which are held securely in the double driving gear. These rollers greatly reduce friction on the drive. With the periphery drive a larger diameter of blade is available for cutting than can be obtained by an arbor driven blade.

Front table is of sufficient size to enable beams and channels to be properly supported while being cut off at any angle up to 45 degrees.

Feed is of the variable friction type, adjustable while the machine is in operation from $\frac{3}{8}$ to 1 inch per minute, is powerful and continuous in its action throughout its entire range.

The friction wheel shaft is provided with a patent ball thrust bearing and carries a hardened feed worm meshing in a bronze worm gear threaded to receive the feed screw which advances the carriage while cutting.

Each machine is furnished complete with two 18-inch diameter saw blades, stop gauges to cut duplicate parts, V block to center rounds, clamp bracket for holding the work and necessary wrenches.

Little Giant Power Hammers

The main frame is one solid casting facilitating and simplifying erection. The ram or striking head is a steel casting with machined bearings and runs in a pressed steel channel which is provided with means for taking up wear. The dies are tempered tool steel placed in machined seats and held in position by dowel pins and keys.

The crank plate and connection between ram and crank pin, form a combination, giving to the ram a balanced reciprocating motion and a perfectly cushioned blow at both upper and lower extremities of the stroke.

Hammer has adjusting knuckle, the raising or lowering of which adjusts the hammer for work on large or small material. Crank box is brass and fitted with grease cup. Babbitted shaft boxes are long with take-up for wear.

The friction spider is keyed to shaft and has a long hub forming bearing for pulley. The pulley has compression grease cup lubricating the pulley through the hollow shaft. The friction is operated by a foot treadle provided with spring for releasing the friction automatically. The friction device disposes of the countershaft as hammer can be belted direct to line shaft and run in either direction. The dies regularly furnished are adapted for general blacksmithing. Special dies of any kind can be supplied.

The "Kerrihard" Power Hammer

The Kerrihard hammer is a combination of the helve and direct acting hammer, doing away with the disc helve and pitman and condensing the entire working parts in such a way as to increase the efficiency of both the helve and direct acting features.

The main frame and anvil is in one piece. The entire casting is strong and heavily proportioned with the right amount of metal in the proper place to withstand the jar and shock of continual hammering.

The head or ram is machined and gibbed to a machined casting, securely fastened to the main frame, thus making provisions for taking up all wear and is adjustable from 3½ to 9 inches and is so arranged that it is always the right distance from the anvil block.

The eccentric strap is the best bronze.

All shafts and pins subject to wear are hammered steel.

The clutch is the friction type of new design. It has but three parts and the slightest pressure upon the tread produces the required blow at the operator's will. It releases automatically.

The spring. There is but one spring in the Kerrihard hammer and that is the finest crucible steel.

Dies. We furnish with each machine one set of regular dies (lower die is flat; upper one slightly rounding on face), which answer for all ordinary work, but we can furnish any style die at slight additional cost.

Will handle about 4-inch material, round or square.	
Two horse power to operate.	
Price	\$260.00

Rochester Helve Hammer

Size "D"

The hickory helve, combined with the cushion spring, gives a springy forging blow.

The hammer is equipped with a shifting device, operated by a handle at the side of the anvil, by which the stroke can be instantly changed from a long, slow stroke to a short, rapid one while the hammer is running; this gives complete control of the hammer so that work of various kinds can be handled on the same machine.

The speed and weight of blow is controlled by the foot-treadle and the old reliable idler pulley.

"Boss" Improved Power Hammer

One H. P. Required

A useful machine in general repair and blacksmith shops, wagon and buggy factories, mines, shovel factories, etc.

A piece of 1½-inch square iron 6 inches long has been drawn out to 2½ feet with this hammer in one heat. It has welded iron 2 inches thick and as thin as ¼-inch.

Only the best steel is used for hammer dies, and they are carefully fitted so as to be held firmly in place by means of hand-finished keys and dowel pins. The dies of the No. 2 hammer will work to the center of a 24-inch circle and will accommodate material 4 inches thick. Size of No. 2 upper die 2x4, lower die 2x5¼.

These hammers are equipped with the latest friction disc drive which releases instantly.

Portable Hydraulic Presses—No. 292

Showing Press, Pump, Oil Tank, Cylinder and Gauge complete in operation with Beams and Side Bars, for pressing on or off Cranks, Car Wheels, Couplings, etc.

This is a standard portable hydraulic wheel press such as is used in car shops, mine shops, etc., for pressing wheels on and off axles, etc.

The 100-ton No. 292 is the favorite size and is usually carried in Chicago stock.

Sizes and Prices

Hydraulic Press Jack and Independent Pump

This is the latest improved type of portable hydraulic press and jack combined. Pump can be set some distance from the work to make operator less liable to injury from falling parts, etc.

The cylinder is of steel. The pump is of bronze with a hand lever for operating, and is set on a cast iron bed which also serves as an oil or water tank, all self-contained and mounted on a plank.

The press and pump itself with resistance head and bars consists of the cylinder and ram complete, pump, hydraulic gauge with XX pipe and fitting for connecting same. The 10 and 20-ton jacks are furnished with 6-foot lengths of flexible tubing. If flexible tubing is desired on larger jacks, instead of XX pipe, an additional charge will be made according to length.

The four I beams, unless otherwise ordered, are each 40 inches long, with distance pieces between to allow the side bars to pass through. The side bars are long enough to make 8 feet 6 inches in the clear between the I beams, and are fitted with a nut on each end and a washer for the nut and I beams to bear against. Handles furnished on jacks 100-ton or over.

Portable Cylinder Boring Bar

This bar is designed for reboring all sizes of engine cylinders, pumps, air compressors, Corliss valve seats, cranks, large wheels and hammer cylinders in place or in a lathe, and it is built to do hard work.

One end of the bar is held in place by a stationary center, and the other end is held in place by an adjustable center fitted in the stuffing box, which is made in two sizes to fit stuffing boxes from $3\frac{1}{2}$ to $5\frac{1}{2}$ inches, or $5\frac{1}{2}$ to $7\frac{3}{4}$ inches. The centers are hardened and will keep true.

The bar can be turned by hand, by a belt from a motor or small engine, and used in a horizontal, vertical or inclined position.

The tool holder or cutter head is made for three tools, and is fed by a steel screw, which is set in the bar with a bronze bearing. It has a star feed which can be regulated according to requirements for rough or finished cuts.

We furnish with this bar sufficient tools for ordinary requirements, including a wrench for driving the tool holder or cutter head back.

With inquiry please give the largest and smallest diameter and extreme length you wish to bore.

Sizes other than those listed built to suit requirements.

Channon Arbor Presses

Strong, durable and portable machines—indispensable to machine shops for forcing arbors in or out of work, pressing bushings in or out, small broaching, punching, etc.

They not only save labor, but prevent splitting, springing and battering of finished work which usually results from the use of a hammer or sledge. May be used on the bench or on the bed of any lathe from 12 to 18-inch swing. Body castings are box type design, strong and heavily reinforced to prevent fracture.

Rack and pinion of machinery steel, accurately machined and tested.

No. 2 Press

Channon Straightening Presses

For general machine shop use. Enough shafts, arbors, forgings, drills, reamers, spindles, broaches, etc., bent in using or warped in hardening may be rescued from the scrap heap to pay the initial cost of a press many times over. The work is more quickly and accurately done than the old way of hammering, lathe centering and testing.

Body castings are heavily reinforced to resist all working strains and to insure absolute rigidity. Beds are planed true, with groove in which adjustable V blocks are easily movable to accommodate work of various lengths. The center brackets, sliding on grooved shafts, are also adjustable and always in perfect alignment. Thrust block on screw is of machinery steel, case-hardened and adjustable centers are of tool steel, hardened.

No. 1—Bench Press and Centers

No. 4 is of different construction and mounted on wheels.

Size number	1	2	3	3-A	4
Capacity—will bend or straighten up to diam., ins.	2	2½	2½	3	4
Height of body casting, inches	13	16	23½	24	33
Length of bed, inches	15	20	34	34	48
Greatest distance between centers, inches	33	40	53	53	—
Centering shaft, diameter and length, inches	1½x40	1½x49	1½x64	1½x64	—
Lever, diameter and length, inches	¾x28	1x34½	1x36	1x36	1½x48
Screw, diameter and pitch, inches	1½x4	1½x4	2x4	2x4	3½x5
Net weight, pounds	135	265	500	725	900
Price each	\$90.00	\$120.00	\$200.00	\$360.00	\$420.00

No. 3 will straighten crank shafts not over 52 inches long that will swing within a 10-inch circle.

No. 4 has square head plate supported on four studs 7 inches apart; travel of screw, 7 inches.

"20th Century" Balancing Tools

Always Level—Ball Bearings

For balancing pulleys, cones, armatures, fly-wheels, polishing wheels, etc. No leveling or adjusting necessary. Always ready for use, no matter where or how you place them.

No. 1 is bench size, others are floor type.

No.	Capacity, Pounds	Swing, Inches	Greatest Distance Between Standards, Inches	Weight, Pounds	Price
1	800	22	20	30	\$40.00
2	800	46	80	80	\$6.00

3	5000	72	72	350	\$190.00
4	10000	96	96	785	\$250.00

No. 1—Bench Size

Garage Equipment Weaver 20 Ton Garage Press

One of the necessary labor-saving machines for the modern repair shop. Used for straightening shafts or axles; pressing bearings or hubs in or out of wheels; forcing gears or bushings on or off and for many other operations crudely performed by improvised means.

This press is designed especially for garage and repair shop service and is strongly and compactly built. The unusual width will permit the largest automobile wheel to be inserted intact, while the great depth adjustment provides for extremely large work—crank shafts and similar bulky pieces can be easily handled by reason of the divided bolster. Press may also be operated in a horizontal position by laying it over on the side.

Leverage.—The 15-inch hand wheel will supply sufficient leverage for light work—the maximum pressure of 20 tons is secured by means of ratchet lever shown.

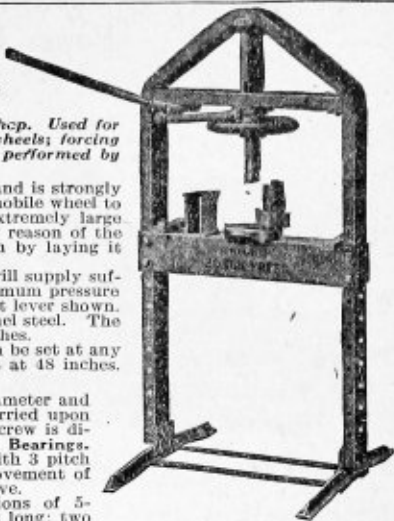

The frame is one piece of heavy channel steel. The width between frame uprights is 32 inches.

The bolster which carries the plate can be set at any desired height with extreme adjustment at 48 inches. The bolster or cross piece is divided.

The hand wheel is 15 inches in diameter and the weight of wheel and screw is carried upon ball bearings. The thrust of the screw is directed against heavy Bronze Thrust Bearings. The screw is 2 inches in diameter with 3 pitch Acme thread and has a range of movement of 12 inches. The screw does not revolve.

Equipment Supplied.—Two sections of 5-inch channel iron blocking, 8 inches long; two extension arms to attach to either end of bolster; also vise block equipment. Floor space 36 x 36 inches. Weight crated 450 pounds.

Price each.....\$60.00

The Auto Twin-Jacks

A Combination Lifting Jack, Turntable and Transporting Truck

These jacks are generally conceded to be essential to the economical operation of public garages, salesrooms, repair shops or storage rooms.

A few turns of the crank handle raises one entire end of the car and supports it firmly and securely upon the large ball and roller bearing casters. With one of these jacks under each axle, a car can be turned completely around within its own length, pushed sideways or manipulated upon the floor in any desired manner. One man can easily handle the heaviest pleasure car. Invaluable for placing cars in close formation in the garage, storage or showroom—will economize time as well as floor space. Used largely for unloading cars from freight cars.

The Extra Heavy Type was put on the market to handle light trucks or extremely heavy pleasure cars—the caster yokes on this type are heavy cast steel—each wheel revolves upon two sets of steel balls. The wheels are 7-inch diameter, with roller bearing hubs as shown.

No. and Style.....	No. 20 Reg. Jack	No. 36 Ex. Heavy
Lifting capacity, pounds.....	4,000	8,000
Diam of Wheels, inches.....	4½	7
Weight each, pounds.....	60	110
Price of two (one for each axle).....	\$20.00	\$36.00
Single jacks, price each.....	12.00	20.00

Showing Extra Heavy Type, Capacity 8,000 lbs.

The Auto Ambulance For Disabled Cars

This is the only practical "towing device" that we know of—the wheels are cast steel and have three-inch tires—the axle revolves upon roller bearings and is 1½-inch diameter. Axle extends entirely through the frame, giving abundant strength for the heaviest cars.

This device can be quickly and securely clamped to either front or rear axle of any car. Where either one or both of the front wheels of the car are disabled, the ambulance attaches to the center of the front axle—the crippled car is then towed by the tongue of the ambulance which is telescopic and made of double strength steel tubing, adjusting every 2½ inches from 6½ to 12 feet, with a secure pin adjustment.

Height of the standard may be varied as conditions demand, by means of a heavy pin or key which rests upon the top of the frame socket. Two sockets are provided in the frame to permit the standard being set either in front of or behind the axle of the ambulance.

Shipping Weight, 140 lbs.

Price, Complete, \$30.00

Power Punches and Shears

Style G, Single, Belted, with 24-inch Throat and Architectural Jaws

Style F, Double, with 20-Inch Throat, Motor Driven, with Gear Guards

These machines are well designed, strong and substantial. Any style of attachment for working structural steel shapes can be supplied promptly. We can also supply deeper throat machines than listed below.

The movement of the ram is of the cam pintle type, in which there is very little wear, and the gib, which is adjustable for taking up the wear, is of phosphor bronze.

Shaft is a special forging. The gears are cast from cut gear patterns to insure smooth running. Cut gears may be had at extra price. The automatic stop is simple and positive. The jaws of the clutch are lined with tool steel. Wear on the jaw does not injure main part of clutch or gear. Strippers and hold downs are all adjustable. Attachments for architectural jaws are cast steel.

Punches and Shears with longer throats and other special attachments upon request.

Style "L" Rapid Action Punch

Cut shows machine fitted with an architectural jaw, but other attachments may be fitted to it, such as bar and round iron shear, angle shear or splitting shear. Is equipped with adjustable automatic stop so operator can bring machine to a stop at any point of stroke. A brake in front of face plate will stop punch at proper point after release of clutch. All punch and shear blocks, clutch and strippers are made of steel, and main eccentric shaft a steel forging.

Throat	Punch	Will Shear				Weight	Price
		Flat	Round	Plates	Angles		
10	$\frac{1}{2} \times \frac{1}{2}$	$3 \times \frac{1}{2}$	$\frac{3}{8}$	$\frac{1}{8}$	$2 \times 2 \times \frac{1}{8}$	2150	\$336.00

24	$\frac{1}{2} \times \frac{1}{2}$	$3 \times \frac{1}{2}$	$\frac{3}{8}$	$\frac{1}{8}$	$2 \times 2 \times \frac{1}{8}$	4800	600.00

Combined Stake Riveter and Punch

Our machines of this style are equipped with adjustable automatic stops which enable operator to bring punch to a stop at any point of stroke. All rivets are put in from top. An automatic hold up clamps sheets before rivet is headed.

One punching and one riveting attachment with wrenches and strippers are furnished with each machine. The stake and main eccentric shaft are carbon steel forgings.

The machine should make about 80 strokes per minute.

From 20 to 30 per cent more work can be done with these machines than with a pneumatic riveter, and a skillful operator can do from 75 to 90 per cent more work with a Stake riveter than can be done by hand riveting in the same length of time.

These machines cannot be excelled for working on hot water boilers, riveting pipes, conveyors, coal chutes, smoke stacks, etc.

Extra stakes for smaller diameter of pipes can be furnished.

Length Stake	Diameter Stake	Riveting Capacity	Punching Capacity	H. P.	Weight	Price
8	6	$\frac{1}{4}$	$\frac{3}{8} \times \frac{1}{8}$	2	2850	\$ 450.67

Punching and riveting attachments furnished with each machine.

No. 42 Boiler Makers' Hand Power Punch

Equipped with structural jaw for working angles, channels, etc. Will punch $\frac{3}{4}$ -inch hole in $\frac{1}{2}$ -inch steel plate.

Will punch to the center of 31 inches.

Weight of this machine, 2500 pounds.

Machine may be fitted with plain jaw.

Ball Bearing Punch

No. 20

For structural and sheet metal workers.

Made of Neckrome steel and heat treated throughout. It will rivet as well as punch holes.

Capacity, $\frac{1}{2}$ -inch holes through $\frac{1}{2}$ -inch iron. Depth of throat, 2 inches. Height of throat, $1\frac{3}{4}$ inches. Weight complete, 20 pounds.

Price, including one punch and die and base. \$31.50

Price without base. 29.50

Punches and dies, rectangular stock, $\frac{1}{4} \times \frac{1}{2}$ -inch to $\frac{3}{4}$ -inch. Price each. \$0.75

No. 40 Punch

Similar to No. 20 except is equipped with ratchet head and socket handle. Capacity, $\frac{3}{4}$ -inch holes through $\frac{3}{4}$ -inch iron. Depth of throat, 3 inches. Height of throat, 2 inches. Weight complete, 51 pounds.

Price without base. \$100.00

Price base, extra. 4.00

Price extra punch and die, each. 1.50

Ball Bearing Punch

No. 15

One-half turn of lever drives punch through $\frac{1}{4}$ -inch metal.

Capacity, $\frac{5}{8}$ -inch hole through $\frac{5}{8}$ -inch iron. Punch in center of $7\frac{3}{4}$ inches. Height of gap, $\frac{3}{8}$ inch. Has ratchet head. Weight complete, 21 pounds.

Punches and dies carried in stock, $\frac{3}{8}$ -inch to $\frac{1}{2}$ -inch by $\frac{1}{2}$ -inch.

The feature of this tool is its deep throat capacity. It is made of crucible steel casting, heat treated throughout.

Price with ratchet head and one punch and die of stock size. \$50.00

Extra punches and dies, stock sizes, each. .50

Ball Bearing Punch No. 10

Capacity, $\frac{3}{8}$ -inch hole through $\frac{1}{4}$ -inch iron. Depth of throat, $1\frac{1}{2}$ inches. Height of throat, $\frac{3}{4}$ inch. Length over all, 18 inches. Weight complete, $8\frac{1}{2}$ pounds.

Price, with 1 punch and die. \$20.00

Price, with 6 extra punches and dies. 24.00

Price, complete with base and 6 extra punches and dies. 25.00

Extra punches and dies, each. .70

No. 20 Marvel Portable Punch

Made entirely of steel—no castings. Capacity $\frac{1}{4}$ -inch hole in $\frac{1}{4}$ -inch stock. Depth of throat, 2 inches. Length over all, 38 inches.

When not otherwise specified, a $\frac{1}{4}$ inch punch and die is sent. Other sizes up to $\frac{1}{2}$ -inch can be furnished. Weight, 16 pounds.

Price including one punch and die. \$19.50

Junior Punch No. 5

The lightest and most powerful punch of its size made. Will punch $\frac{1}{4}$ -inch hole through 18 gauge iron.

Price, including 3 sets of punches and dies, $\frac{1}{8}$, $\frac{3}{8}$ and $\frac{1}{2}$ -inch. \$8.00

Extra punches and dies, per set. .80

Other sizes made to order. 1.00

Weight, $2\frac{3}{4}$ pounds. Punch in center of 3 inches. Length over all, $8\frac{1}{4}$ inches. Height of gap, $\frac{5}{8}$ -inch.

Whitney Portable Metal Punches

No. 1 Punch

All parts are drop-forged, except pipe handles. Total length is 34 inches. Capacity, $\frac{1}{2}$ -inch hole through $\frac{1}{4}$ -inch boiler plate, or equivalent. Price includes two punches and one die, any size from $\frac{1}{4}$ to $\frac{3}{4}$ by $\frac{1}{2}$ ths. When ordering, state sizes desired. Weight, 21 pounds.

Price. \$20.00

No. 2 Punch

All parts on this smaller punch are drop-forged, including the handle. Total length, 23 inches. Capacity, $\frac{5}{8}$ -inch hole in $\frac{1}{4}$ -inch iron or equivalent. Includes two punches and one die, any size from $\frac{1}{8}$ to $\frac{1}{2}$ -inch by $\frac{1}{2}$ nds. Weight, 15 pounds.

Price. \$15.00

Extra Punches or Dies for No. 1 or No. 2, \$0.70 each Punch or Die.

No. 1. Handy Punch

Will punch $\frac{1}{4}$ -inch hole in $\frac{1}{4}$ -inch plate, to the center of a 5-inch circle. Weight, 70 pounds.

Price.....\$13.75

Price includes three punches and dies.

Tinnners' Punches

No. 5

Marvel
Multiple
Punches

No. 10. Has 4 punches, one each $\frac{1}{8}$, $\frac{3}{8}$, $\frac{1}{4}$ and $\frac{5}{8}$ inch.

No. 11. Has 4 punches, one each $\frac{1}{4}$, $\frac{5}{8}$, $\frac{3}{8}$ and $\frac{7}{8}$ inch.

No. 12. Has 3 punches, one each $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ inch.

One punch is used at a time, all the punches may be left in place at all times if desired. The punches are simply dropped in place and the steel block shown with thumb screw can be rapidly shifted over any punch desired and punch tightened by turning the thumb screw.

No.	Throat Depth, Inches	Capacity	Weight, Pounds	Price Each
10	4	$\frac{1}{8}$ hole in $\frac{1}{4}$ -in. stock	90	\$ 40.00
11	5	$\frac{3}{8}$ hole in $\frac{3}{8}$ -in. stock	300	85.00
12	6 $\frac{1}{2}$	$\frac{1}{2}$ hole in $\frac{1}{2}$ -in. stock	675	150.00

Marvel Combined
Punch and Shear

Has double levers.
Punches $\frac{3}{8}$ -inch hole in $\frac{3}{8}$ -inch stock or $\frac{1}{2}$ -inch hole in $\frac{1}{4}$ -inch stock.
Shears $\frac{1}{2}$ x2 flat and $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ -inch round iron.

Throat 2 $\frac{3}{4}$ inches. Weight, 155 pounds.
Cuts $\frac{1}{4}$ x2x2 angle iron in two cuts.

Price, with two levers, three punches and dies and gauge for flat and round shearing.....\$54.00

With heavy iron legs, 210 pounds. Price each 59.00

Portable Pneumatic Punch and Riveter

This riveter is especially designed to meet the requirements of work in roundhouses, copper shops, or wherever light iron work is to be done. By its use one man can do the work that ordinarily would require three or four men, handling a big sheet in a stationary punch.

It is capable of driving rivets with less air than any other machine. Ordinarily, a number of strokes are necessary to fasten every rivet, but with this machine only one stroke is required. Because of the slow movement of the die during lever action, plenty of time is given for the metal in the rivet to flow and fill the hole completely, as well as an opportunity for the rivet to set before the pressure is completely released on the return part of the lever action. This insures tight rivets.

Each riveter is supplied with the necessary handles, lubricators, one set of sample riveting dies, and suspension bail or links. No foundation bolts furnished unless especially ordered.

Specifications

Six-inch reach, 6-inch gap. Cylinder diameter 8 inches. Exerts 12 tons pressure on die at 80 pounds air pressure. Will punch $\frac{3}{8}$ to $\frac{1}{2}$ -inch hole in $\frac{1}{4}$ -inch plate. Rivets $\frac{1}{4}$ -inch rivets cold. Total die stroke $\frac{3}{8}$ -inch. Net weight 225 pounds.

Price each	\$195.00
With foot treadle, extra	6.50
With riveting dies, extra	6.50

Hand Power Concrete Reinforcing Bar Cutters

Fig. G No. 1—0 to $\frac{3}{4}$ Bars

Fig. G No. 2— $\frac{3}{4}$ to $1\frac{1}{4}$ Bars.

The Kongo All-Steel Bar Cutters

With the No. 1 one man can cut off $\frac{3}{4}$ -inch bars and with the No. 2 two men can easily cut off $1\frac{1}{4}$ -inch high-carbon bars. Cast steel construction, making a light machine, convenient to handle, simple and practically unbreakable. The cutting jaws are arranged so that action becomes more powerful as the resistance increases in advancing the cut, so that the bar will not be pushed away by the knives. When cutting, the knives advance, making a clean cut, without fractured ends.

No.	Shearing Capacity, Square, Twisted or Round, Inches	Weight of Machine, Pounds	Weight of Handle, Pounds	Total Weight, Pounds	Price Each
1	0 to $\frac{3}{4}$	100	35	135	\$100.00
2	$\frac{3}{4}$ to $1\frac{1}{4}$	185	70	255	150.00

Compound Lever Sheet Iron Punches, 15-Inch Throats

Operated by either treadle or overhead lever. Lever arranged to work from front or back. Steel plunger, wrought iron lever, adjustable back gauge and an adjustable side pin gauge for punching holes equal distances apart. $\frac{3}{8}$, $\frac{1}{4}$, $\frac{5}{8}$ -inch punches and dies furnished, or larger up to $\frac{5}{8}$ -inch (larger sizes extra). In ordering, state size of punches and whether treadle or overhead lever is desired. Top lever to work front or back for \$1.50 extra. With both treadle and lever for \$6.00 extra net. To punch $\frac{3}{8}$ in $\frac{5}{8}$ and heavier requires an extension on treadle.

No. 136.	To punch $\frac{3}{8}$ in $\frac{1}{8}$.	Weight, 350 pounds.	Price	\$47.00
No. 137.	To punch $\frac{1}{4}$ in $\frac{3}{8}$.	Weight, 400 pounds.	Price	52.00
No. 138.	To punch $\frac{1}{4}$ in $\frac{1}{4}$.	Weight, 425 pounds.	Price	56.00
No. 139.	To punch $\frac{5}{8}$ in $\frac{1}{4}$.	Weight, 500 pounds.	Price	62.00
No. 140.	To punch $\frac{3}{8}$ in $\frac{5}{8}$.	Weight, 800 pounds.	Price	75.00
No. 141.	To punch $\frac{3}{8}$ in $\frac{3}{8}$.	Weight, 1000 pounds.	Price	87.00

No. 12 and larger sizes will be furnished with an extra 9-inch top blade for trimming $\frac{3}{4}$ and $\frac{5}{8}$ plates.

The following items are extra net: With lever socket on each side, as shown on large cut, to operate punch from front or back, on No. 2 and No. 3, \$1.50; Nos. 4, 5, 6, 8 and 10, \$2.00; No. 12, \$2.50; No. 18 and larger, \$3.00. Punches $\frac{3}{4}$ -inch and larger, or special square punches, also blades fitted to cut angle iron, furnished for the proper difference in price.

Hand Power Punches and Shears

Simple and substantial machines, well adapted for work within their listed capacities. All machines should be rigidly fastened to floor to secure good results.

No. 33 Combined Punch and Shear

Will punch $\frac{3}{8}$ -inch hole in $\frac{1}{2}$ -inch plate to the center of a 6-inch circle.

Will shear $1\frac{1}{2} \times 2\frac{1}{2}$ -inch flat bars or $\frac{3}{8}$ -inch round iron.

Weight, 350 pounds.
Price each.....\$43.50

No. 6 Combined Punch and Shear

Will punch $\frac{1}{2}$ -inch hole in $\frac{1}{2}$ -inch plate to the center of a 6-inch circle.

Will shear $\frac{1}{2} \times 4$ -inch flat bars or 1-inch round. Furnished with three punches and dies and a lever bar. Weight, 510 pounds.

Price each.....\$73.50

No. 15 Combined Punch and Shear

Will punch $\frac{5}{8}$ -inch hole in $\frac{1}{2}$ -inch plate to the center of a 14-inch circle.

Will shear $7 \times \frac{1}{2}$ -inch flat, $7 \times \frac{1}{2}$ band iron or 1-inch round bars.

This machine is of very generous proportions (note weight) and built for continuous heavy punching and shearing.

Has three pairs of knives. Three punches and dies and lever bar go with machine. Weight, 1000 pounds. Price each.....\$103.00

Angle shear for $2 \times 2 \times \frac{1}{2}$ -inch angles. Extra.... 49.50

Nos. 30 and 40. Splitting Shears

No. 30

No. 30. Will shear $\frac{1}{4}$ -inch plates or less, any width or length. Shear blade $6\frac{1}{2}$ inches. Weight, 240 pounds.

Price.....\$55.00

No. 40. Will shear $\frac{3}{8}$ -inch plates or less, any width or length. Shear blade $7\frac{1}{2}$ inches. Weight, 700 pounds.

Price.....\$107.00

No. 3. Combined Splitting Shear and Rod Cutter

Will shear $\frac{1}{8}$ -inch sheet metal any width or length. Will shear $\frac{1}{2}$ -inch diameter round iron or less. Weight, 120 pounds.

Price.....\$29.50

"Marvel" Rod Cutter

Cutting dies have round openings of correct size to cut off rods and wire, which insures good work with ends round and true.

No.	Price Each	Cuts Rods Mentioned Below, Also Intermediate Sizes, Inches	Weight, Pounds

Price each.....\$43.50

The Potstada Metal Shear

AA Vise Tool

Considering weight (12 pounds) is the strongest and most durable metal shear on the market today. It cuts up to $\frac{1}{8}$ -inch steel plate.

The shear is drop forged steel the handles and stand of malleable iron it will stand long and hard usage.

Is composed of seven parts, all numbered so that the knife or any of the parts can be readily replaced in case of breakage.

Price \$7.50

Shear with Bench Bracket

The Little Giant Punch and Shear

A simple, powerful and durable machine at low cost.

The punches, dies and shears are of tool steel and guaranteed equal to the best made.

Equipment

Four hook bolts for securing to block one stripper, one spanner wrench, one plate to place under die when punching thin iron, one brush for oiling punches, five punches and five dies.

Price per set..... \$5.00

"U" Bending Tools

These tools are suitable for bending round, square, flat or square twisted bars into "U" shape or any angle up to 180 degrees with a radius at point of bending to correspond to size of forming pin.

No. 1. "U" Bender—for cold bending. Flat $\frac{1}{2}$ x 2-inch, round $\frac{1}{2}$ -inch, square $\frac{1}{2}$ -inch, square twisted $\frac{1}{2}$ -inch, or equivalent. For hot bending: Flat $\frac{1}{2}$ x 2-inch, round $\frac{3}{4}$ -inch, square $\frac{3}{4}$ -inch, square twisted $\frac{3}{4}$ -inch, or equivalent. Net weight 65 pounds. Price each.....\$40.00

No. 2. "U" bender—for cold bending: Flat $\frac{1}{2}$ x 3-inch, round 1-inch, square $\frac{3}{4}$ -inch, square twisted $\frac{3}{4}$ -inch, or equivalent. For hot bending: Flat $\frac{1}{2}$ x 3-inch, round 1 $\frac{1}{4}$ -inch, square 1 $\frac{1}{2}$ -inch, square twisted 1 $\frac{1}{2}$ -inch, or equivalent. Net weight 185 pounds. Price.....\$50.00

Extra dies for sharp corner and angle iron bending furnished upon application.

Showing Side View of No. 2

Eye Benders Nos. 1, 2 and 3

No. 1. Takes stock $\frac{1}{2}$ inch and less. Bends rings and eyes up to 2 $\frac{3}{4}$ inches outside diameter. Net weight 62 pounds. Price each.....\$40.00

No. 2. Takes stock $\frac{3}{4}$ -inch and less. Bends rings and eyes up to 7 inches outside diameter. Net weight 83 pounds. Price each.....\$53.50

No. 3. Takes stock 1 $\frac{1}{2}$ -inch and less. Bends rings and eyes up to 7 inches outside diameter. Fitted with special hand lever for operating offset dog. Net weight 152 pounds. Price each.....\$80.00

Above prices include one size of forming pin.

Extra forming dies on application.

Eye Bender No. 12

A convenient machine for mounting on bench for forming up light stock without the necessity of heating. Illustration shows a round wire in process of bending into the form of an eye. Grip dogs are adjustable to suit thicknesses of stock to be bent. Operating lever is about 20 inches long, and by pulling this around the stock may be formed into a hinge eye as shown in Fig. 4. Eye may be centered by bending stock back against the guide block at right of illustration. Stop block on machine may be set to suit the degree of bend to be made.

Capacity, $\frac{3}{8}$ -inch diameter round rod or wire, $\frac{1}{2}$ -inch or under square rod, $\frac{1}{2}$ x 1-inch flat stock or equivalent. Net weight, 40 pounds. Price each.....\$40.00

"Hanson" Improved Bar Bender

Bends cold steel quickly up to capacity listed without jerking—just a slow steady pull.

This is the popular bender with the patent sliding shoe—on the bending point of the lever. This sliding shoe eliminates all friction on bar during the bending operation.

Made of wrought steel shapes throughout; no castings of any kind—consequently light and easily portable from job to job—and unbreakable.

All working parts are forged of open hearth steel billets, properly machined and bolted onto a steel plate.

Wearing parts are case-hardened.

Joint of bending lever is protected from scale and grit by being connected on the under side of plate.

Clamping device is an eccentric lever 24 inches long—easily operated. It is an instantaneous lock against clamping die, which is of sufficient length to keep bar rigid and insure a perfect bend.

Bending die has three separate radius joints and can be turned to suit radius of bend for different sizes of bars.

Sizes and Capacities

No.	Capacity Square Cold Twisted Bars, Inches	Length of Bending Lever, Feet	Approx. Weight, Lbs.	Price
2	$\frac{1}{4}$ to $\frac{5}{8}$	3 $\frac{1}{2}$	65	\$ 60.00
3	$\frac{3}{8}$ to 1	6	250	150.00
4	$\frac{1}{4}$ to 1 $\frac{1}{4}$	7	365	187.50
5	$\frac{1}{4}$ to 1 $\frac{1}{2}$	8	415	210.00

No. 2 size is without leg base—to be bolted to bench, for bending stirrups and light bars.

No. 5. Machine with Leg Base. The most popular machine.

Bar Bending Tools

Size 0 machine is intended for forming light stock into rectangular shapes without first heating the same and can conveniently be mounted on an ordinary work bench. The operating lever is about 20 inches long and by pulling this around it rotates the slotted die in which stock is held, forcing the extended end of stock against the stationary pin, thus forming it to any angle desired less than 90 degrees. When a greater degree of angle is desired it may be accomplished by means of special forming dies made to order.

Capacity— $\frac{1}{4}$ inch or smaller round wire or rod, without heating. $\frac{3}{4}$ -inch or smaller square rod, without heating. $\frac{3}{4}$ -x-1-inch or equivalent flat stock, without heating. Gross weight 45 pounds. Net weight 25 pounds.

Price.....\$40.00

No. 1 machine is supported by cast iron lug which fits into socket and may therefore be easily removed and put out of the way when not in use.

Bends flat stock up to 2 inches wide by $\frac{3}{4}$ -inch hot, and round or square bars up to $\frac{3}{4}$ -inch hot, or $\frac{1}{2}$ -inch cold. Bends angle iron if a "V"-shaped piece of stock is cut from one leg. Will form any angle from zero to 90 degrees.

Angles less than 90 degrees may be made by the use of a special "sharp angle die." For cold bending, we recommend using steel faced dies.

Net weight 52 pounds. Gross weight 62 pounds.

Price with cast iron dies.....\$33.50

Price with dies faced with tool steel for cold bending.....40.00

Nos. 2 and 3 machines are similar to No. 1 but are heavier and stronger, covering a wider range of work.

No. 2 bends flat stock up to 2 inches wide by $\frac{1}{2}$ -inch thick and round or square stock up to 1-inch hot. Bends $\frac{3}{4}$ -x-1 $\frac{1}{2}$ -inch stock and under edgewise hot. Bends angle iron if a triangular piece of stock is cut from one leg.

The No. 3 machine is exactly the same as the No. 2 excepting that the dies are two inches higher or 4 inches.

No.	Gross Weight, Lbs.	Net Weight, Lbs.	Price with Cast Iron Dies	Price with Steel Faced Dies
2	150	120	\$47.00	\$53.50
3	170	140	47.00	53.50

Extra dies for edge bending sharp angle bending, etc., for any of the above machines upon application.

Showing No. 2

WIDE RATCHET HANDLE
IS 24 INCHES LONG

Angle Bar Benders for Concrete Bars

These machines are strong and compact and may be operated by one man for bending iron rods

one inch and under without heating same. These benders are designed particularly for high carbon concrete reinforcing bars whether square twisted, round or square corrugated or any other reinforcing bars of high carbon stock. Fitted with auxiliary ratchet lever which operates a pinion against a series of teeth in the frame at a large ratio, thus making them very powerful. This lever is 36 inches long.

Dies are adjustable by means of set screws to suit thickness of stock to be bent.

No. 4 Bender—For cold bending: Flat $1\frac{1}{2}$ -x-2 inches, round $1\frac{1}{2}$ inches, square 1 inch, square twisted 1-inch or less. For hot bending, $1\frac{1}{2}$ -x-2 inches, round $1\frac{1}{2}$ inches, square $1\frac{1}{2}$ inches, square twisted $1\frac{1}{2}$ inches or less.

Complete with stand, weight 460 pounds net.

Price each.....\$120.00

Complete without stand, weight 300 pounds net. Price each.....100.00

Helix Coiling Machine

For Reinforced Concrete Columns

Wire spirals for reinforced concrete columns can be wound rapidly and profitably on this machine, which can also be used for various other purposes. The wire must be cut to length before it is fed to the machine.

It consists of a housing in which are mounted shafts with feed rolls on the ends which feed the wire by means of pressure. On the lower feed shaft is a hub on which is a projecting pin which acts as a lock on which the spiral is wound. The pipe is supported in a stand with rolls allowing it to revolve and as it revolves with the feed rolls, the spiral revolves while it is winding.

The machine may be adjusted for either open or close wound spirals and is made in two sizes.

No. 350—For $\frac{3}{4}$ -inch wire and smaller, makes spirals 4 to 30 inches in diameter, 17 feet long. Each.....\$300.00

No. 580—For $\frac{3}{4}$ -inch wire and smaller, makes spirals 12 to 40 inches in diameter, 17 feet long. Each.....\$580.00

Price is without countershaft and with one set of rails.

Model A

Equipped with six different quadrants for bending pipe $\frac{1}{2}$ -inch to 2-inch diameter, inclusive, cold without filling.
Price.....\$300.00

Model B

Equipped with three quadrants for bending pipe $2\frac{1}{2}$ -inch, 3-inch and $3\frac{1}{2}$ -inch diameter.
Price.....\$400.00

No. 5-A Pipe Bending Machine

For cold bending piping of steel, iron, copper, brass, etc., up to 2-inch, inclusive. Furnished with quadrants for 1-inch pipe with radius of 6 in., $1\frac{1}{4}$ -inches with radius of 9 in., $1\frac{1}{2}$ -inches with radius of 12 inches and 2-inches with radius of 14 inches.

Net weight 811 pounds. Price with plain stand and four adjustable quadrants as above.....\$220.00
Special quadrants furnished at extra cost.

Self-Adjusting Conduit Hickey

This hickey will bend conduit in any shape from $\frac{1}{4}$ inch to 1 inch without having to be adjusted in any way. The natural pull on the handle fits the hickey to the conduit when a positive grip which prevents it from slipping. When using hickey on the floor as in illustration it is used like the old style of hickies, but has the added advantages of the disk which greatly facilitates the bending of the pipe.

It can also be used with a bench vise, or with a pipe standard at the side of bench.

The hickey is light and can be easily carried in a workman's kit, or from floor to floor, since the weight is only 5 pounds.

It will not kink or flatten the conduit because of the curved disk.

Price each.....\$10.00

Showing method of applying Hickey when used on the floor.

Specifications

"Cincinnati" Portable Electric Drills

Air-Cooled—Ball-Bearing—Attach to any Lamp Socket

Built in all sizes and styles for drilling in iron or steel up to 2½ inches and in wood up to 3 inches. Electrically, as well as mechanically, they are correct, up-to-date and high-grade in every respect. Motor windings are fully enclosed, dirt and dust proof and all working parts protected from injury.

Air cooled by means of a fan mounted on the armature shaft—forcing a strong current of air through the ventilation holes in motor housing and end cap.

Armature is built up of highest grade electrical sheet steel wound with special magnet wire—thoroughly insulated against possibility of short-circuiting or grounding. **Field Coils** are form wound, of magnet wire, taped, baled and insulated. **Commutator** is composed of segments of hard drawn bar copper, insulated with amber mica.

Gears are steel—properly hardened and enclosed in the case at the chuck end of the motor. All gears run in grease and are separated from the motor proper by an aluminum diaphragm plate.

Ball Bearings—Armature is mounted on ball bearings and chuck spindle is fitted with ball bearing end-thrust—reducing friction to a minimum.

Switch is entirely enclosed in a pocket on the side of the motor housing and operated through one of the side handles of the drill.

Carbon Brushes are mounted in die-cast brush holders and held firmly against commutator by two springs pressing from the rear, insuring perfect contact.

Side Handles are of seamless steel tubing and knurled to give a firm grip. One operates the switch—other handle is detachable for close corner drilling.

Lubrication by graphite grease in gear case—6 months' supply. Oil cups for spindle bearings.

Current—Drills supplied for direct or alternating current, also Universal type for either current.

Direct Current Drills—Standard tools are wound for 110 and 220 volts. Specially wound for 50 to 600 volts as required.

Alternating Current Drills—Motors are of the well known squirrel-cage induction type—standard tools wound for 110 and 220 volts, 60 cycles, single, 2 or 3 phase. Specially wound for 110 to 500 volts and 25, 60 or 133 cycles and 1, 2 or 3 phase.

Single Phase tools can be run from a lamp socket.

Two and Three Phase motors cannot be run from a lamp socket, but must be operated from power circuit. Where voltage is over 250, 2 or 3 phase should be ordered.

Single Phase Machines can be run from a lamp socket on the 2 or 3 phase circuit by attaching to one phase of the line.

Drills over 1½ inch capacity and grinders over 1 H. P. furnished for two or three phase only.

Universal Drill

Same Drill for
Either Direct
or Alternating
Current
All Aluminum
and Housing
End Caps

Very handy for outdoor portable work where different currents are encountered. A drill wound for 110 volts can be used on D. C. or A. C. current of the same 60 cycles single phase. A drill wound for 220 volts can be used on D. C. or A. C. current of same voltage, 60 cycles, single phase. Size U has one side handle—other sizes have two side handles—one is detachable for close corner work, one operates switch.

Type	Price	Capacity, in Steel, Inches	Weight, Pounds	Speed, R. P. M.
U	\$44.00	1½	7	1000
UB	48.00	1¾	8	900
UT	55.00	2	12	800
UH	72.00	2½	18	500
*UD	76.00	1½	19	450-750
US	98.00	2	36	250
*UU	106.00	2½	38	250-400

*Two speeds.

Hand or Breast Drills

Direct and Alternating Current

Cut shows Side Drive Drill with detachable handle for close corner work—can supply center drive drill at same price. Fitted with chucks.

Taper sockets can be had with ½ inch drills if desired. Screw feed can be furnished at extra price.

All drills will bore in wood to a greater capacity. Can furnish special slow feed drills for drilling in marble, glass, slate, etc.

Alternating current drills weigh slightly more. *Has two speeds, 450 and 750.

Direct		Alternating		Capacity in Steel	Speed R. P. M.	Wt. D. C. Lbs.

*Two speeds.

"Cincinnati" Heavy Duty Electric Drills

Portable—Screw Feed—Direct and Alternating Current

Side Drive

Particularly adapted for hard usage. Fitted with telescopic screw-feed and shovel handle. Has No. 2 Taper socket— $\frac{1}{2}$ inch chuck for smaller bits furnished as an extra. Switch operated from one side handle—other handle is detachable.

Capacity in Steel Inches	Speed R. P. M.	Weight D. C. Lbs.	Direct		Alternating	
			Size	Price	Size	Price

$\frac{3}{4}$	220-410	40	EE*	94.00	EEA	96.00

*Are two speed drills.

Center Drive

Showing largest type of drills from 1 to $2\frac{1}{2}$ inches.

Gears and armature are mounted on ball bearings and chuck spindle is fitted with end thrust bearings, insuring easy running. All working parts hardened. Switch in one handle, other handle is detachable.

Capacity in Steel Inches	Speed R. P. M.	Weight D. C. Lbs.	Direct		Alternating	
			Size	Price	Size	Price
1	200	40	F	\$ 96.00	FA	\$ 98.00

Portable Scotch Radial Drill
—Detachable Motor

Has rack on spindle casing of the drill motor which is detachable from the stand and can be used independently as a portable screw feed drill. Has a 5-inch vertical feed and practically the same adjustments as the MO type. Two speeds.

Capacity in Steel Inches	Speed R. P. M.	Weight Lbs.	Direct		Alternating	
			Size	Price	Size	Price
$\frac{1}{4}$	220-400	160	LS	\$126.00	LSA	\$132.00
1	175-350	200	LO	142.00	LOA	148.00

"OLD MAN" STAND.

Showing screw feed drill in position. Stand can be used with any type of drill over $\frac{1}{2}$ inch capacity. Columns are of Shelby steel tubing and ground. Adjustable vertically and horizontally. Height over all 38 inches, cross arm 12 inches. Weight 80 lbs. Price \$18.50.

"Old Man" Stand

Portable Scotch Radial Drill

Stand has horizontal adjustment by rack and pinion on the cross arm and a vertical adjustment through 34-inch lead screw on upright column. Drill can be set at any angle and has a circle radius of 24 in. in any direction. Has 10-inch hand wheel feed with quick return.

MS size has No. 2 Morse Taper Socket, MO and MM—No. 3, MR has No. 4 and MY has No. 5.

First three sizes have two speeds.

Capacity in Steel Inches	Speed R. P. M.	Wt. Lbs.	Direct		Alternating	
			Size	Price	Size	Price
$1\frac{1}{4}$	155-265	312	MM	\$185.00	MMA	\$200.00
2	95	340	MR	196.00	MRA	210.00

*Two speeds. †Made in two and three phase only.

Write for Special Quotations on Special Electrical Tools.

Electrically Driven Sensitive Drills

Friction Drive

These tools are designed for light work and will drill holes up to 5/8-inch in diameter. The spindle is made of tool steel, is counterbalanced by a spring, and is provided with a ball thrust bearing. The weight and thrust of the friction disc is also carried on a ball bearing.

The table is counterbalanced by a weight in the column and can be swung around out of the way when desired. A finished boss is provided on the base under the spindle for convenience in centering long shafts. There is an index line on column for setting the table central at any height. The friction disc drive permits of quick adjustment of speed and also keeps the power in proper proportion to the size of the drill. Furnished complete, ready to run. No belts, shafting or countershafting necessary.

"Cincinnati" Electric Grinders

The motors, lead wires and brush holders are enclosed, so that short circuiting is avoided, and the vital parts guarded against external injury. Bearings are cone-shaped phosphor bronze, adjustable for wear and fitted with dust caps to protect the bearings and windings from emery and dust.

Tool Post Grinder Without Feed

Practically the same as Type S, listed below, except that it has no horizontal feed, which is not necessary if used on a lathe having compound rest or on a machine tool with feed.

This grinder is particularly adapted for work requiring absolute rigidity. Tool rests and extension mandrel included with sizes P. and P. H. only.

H.P.	Speed R.P.M.	Size of Wheel	Wt. Lbs.	Direct		Alternating	
				Size	Price	Size	Price
1/4	4,200	4 1/2 x 3 1/2	16	P	\$32.00	PA	\$38.00

1	2,000	10 x 1	75	PO	74.00	POA	88.00
2	1,600	12 x 1 1/2	198	PT	110.00	PTA	120.00

Tool Post Grinder With Horizontal Feed

This grinder has horizontal free hand feed, an exclusive feature. Especially adapted for grinding Lathe Centers, Cutters, Reamers, Dies, Rolls, etc., and for surface, parallel and internal grinding jobs of all kinds. Can be used on lathes, planers, boring mills, milling machines or shapers.

Includes one emery wheel, one extension mandrel with wheel, one tooth rest, six feet of cord and plug. Size of mandrel for 1/4 H. P. 4 1/2 in. long wheel 1 1/2 x 3/4 x 3/4.

Size of mandrel for 1/2 H. P. 5 1/2 in. long wheel 2 x 1 x 1/2.

Hand Aerial Grinder or Buffer

Can be used for buffing, polishing or grinding jobs of all kinds, as any kind of wheel can be attached. Can be carried any distance, as any length of cord may be attached.

A 4 to 6-inch extension mandrel is included for close corner, cylinder or hollow work. 1/2 H. P. and larger sizes have eyebolt and spring for overhead suspension.

H.P.	Speed R.P.M.	Size of Wheel	Wt. Lbs.	Direct		Alternating

Cincinnati Electric Grinders

Portable--Air-Cooled

The motors, lead wires and brush holders, are enclosed, so that short-circuiting is avoided and the vital parts guarded against external injury. Bearings are cone-shaped phosphor-bronze, adjustable for wear and fitted with dust caps to protect the bearings and windings from emery and dust.

Single Wheel Bench Grinder

The above portable bench grinder is particularly handy for grinding small tools, etc. It can also be used for buffing and polishing, as any kind of wheel can be attached.

Fully enclosed, dirt and dust proof.

We furnish a tool rest which is detachable. Also an emery wheel and 10 feet of cord with attachment plug.

Twist drill grinding attachment may be added at \$5.00 extra.

H.P.	Speed R.P.M.	Size of Wheel	Wt. Lbs.	Direct Size	Price	Alternating Size	Price
1/4	4200	4 1/2 x 3/8	15	BW	\$30.00	BWA	\$36.00

Two Wheel Bench Grinder

This machine is furnished with a wheel at each end of the spindle—by changing wheels can be used for grinding, buffing or polishing.

Can be set anywhere—runs only when in use. Under immediate control of operator by means of knife switch on the motor.

Sent out with two wheels, as shown, one medium and one hard, also cord and plug.

Twist drill grinding attachment may be added at \$5.00 extra.

H.P.	Speed R.P.M.	Size of Wheel	Wt. Lbs.	Direct Size	Price	Alternating Size	Price

1/2	2500	8 x 3/4	45	BH	48.00	BHA	64.00

Air-Cooled Bench and Floor Grinders

Two Wheel--Heavy Duty

The bench grinder is same as illustration shown—but without the stand. Suitable for heavy grinding of all kinds—can also be used for buffing and polishing. Motor is fully enclosed and equipped with two detachable tool rests and wheel guards. All bearings are adjustable for wear.

The floor grinder, as shown, is the same as the bench, but mounted upon a heavy stand or pedestal fitted with water pot and tool pans.

Extras—

Twist drill grinding attachment.....\$ 7.50
Wet grinding attachment for 1 H. P., \$22.00, 2. H. P. \$26.00, 3 H. P. 30.00

Floor Type

Little Giant Improved Air Drills

All "Little Giant" drills and reversible machines are made after a standard design or pattern varying only in size and construction necessary to adapt them to the particular uses for which they are intended.

The ball bearings on the cranks reduce the loss from friction to a negligible quantity; the increased port areas and directness of port passages practically annihilate wire-drawing effects; the increased diameter of thrust bearings and strengthening of other wearing parts extend the working life of the drill far beyond any previous limits; the hand-holes in the cylinders (in the No. 4 and larger) and the method of bolting the bonnets and gear cases to the cylinders further simplify the problems of repair.

No.	Diameter Piston, Inches	Length Stroke, Inches	Speed Light R. P. M.	Drilling Capacity, Inches	Net Weight, Pounds	Price Each
1	2	1 1/4	340	2	58	\$80.00
2	1 1/2	1 1/8	480	1 1/4	40	75.00
4	1 1/2	1 1/8	700	3/8	22	70.00
1R	2	1 1/8	240	2	60	85.00
2R	1 1/2	1 1/8	340	1 1/4	42	80.00
4R	1 1/2	1 1/4	500	3/8	24	75.00

R after the number indicates reversible drills.

All of these drills may be fitted with internal or compound gearing, which reduces the speed but increases the power and adapts them for heavier work.

Little Giant Wood Boring Machines

Made in a wide range of sizes, the No. 5 and No. 14 being the most popular. Other sizes and styles upon request.

Size	Speed, Light, R. P. M.	Capacity, Inches	Net Weight, Pounds	Price Each
No. 5	650	2	24	\$75.00
No. 14	570	4	32	80.00

No. 4 drilling through a brick wall—holes are clean, round and uniform

Portable Electric Hammer Drills

For Concrete, Brick or Stone

Strikes about 50 times as many blows as a man with a hand hammer, effecting an immense saving in labor over hand methods.

The No. 4 is an all-around tool. Will drill up to 1-inch holes in concrete at the rate of three inches per minute and can be used for chipping, bush hammering, etc., or wherever star drills, chisels, etc., can be used.

Largely used for expansion bolt and hanger bolt work in modern concrete buildings, for pipe openings and electrical work.

Principle of operation is simple, consisting of a motor which drives the plunger of the tool and is connected to it by a flexible magnetic clutch.

The elasticity of the magnetic connection between the sleeve and plunger absorbs the sudden jabs and strains incident to the delivery of the blow and the reciprocation of the plunger, giving a perfect magnetic cushion.

No. D3

Direct Current Drills

No.	Voltage	Power Consumption, Watts	Blows per Minute	Capacity in Concrete	Weight, Pounds	Price Each
D3	110 or 220	150	4000	1 1/2-inch	14	\$105.00

No. D4

Prices on Bits and Drills will be found in another section of catalog.

"Boyer" Pneumatic Riveting and Chipping Hammers Holder-Ons and Rivet Busters

The Boyer Hammer in its various forms is divided into three distinct members, cylinder, handle and valve, a principle of construction that provides for quick examination and economical upkeep and repairs. In each of these members there is a moving part subject to wear but in varying degrees. It is frequently possible to replace but one of these members and obtain a comparatively new hammer as a result. All parts are made with jigs and templates and are absolutely interchangeable.

We supply complete Air Plants, Compressor and Power, Tanks, Tools, Etc.

"Little David" Pneumatic Tools

Riveter with Retainer

Riveter without Retainer

Chipper

Holder On

In the Little David riveter and chipper the valve chamber is independent of the piston chamber, eliminating any chance of injury to the valve, an entirely new construction. The handle is attached to the barrel by means of through bolts and lock washers, no chance of coming loose and easy to take apart without the aid of a vise. Riveters can be supplied with an effective rivet set retainer on order; it can also be supplied as a rivet set.

Style	Size No.	Suitable for	Cyl. Diam.	Stroke, Inches	Air Inlet	Size Hose	Length, Inches	Weight, Pounds	Price Each

Holder On Type 4 HO. Length closed, 14 $\frac{1}{2}$ inches; open 19 inches, including tail piece and rivet set. Length of feed is 4 $\frac{1}{2}$ inches; side to center of rivet set 1 $\frac{1}{2}$ inches; hose connection, $\frac{3}{8}$; weight 26 lbs. Price.....\$33.50

Retaining springs and three rivet sets \$5.50 extra.

"Little David" Piston Air Drills

Reversible and Non-Reversible

The motor is of the angular four cylinder, single acting type, each pair of pistons being attached to opposite throws of a double crank shaft mounted on ball bearings. The connecting rods are provided with roller bearings.

Adapted for drilling, reaming, tapping, flue-rolling and wood boring. Can be had reversible or non-reversible; specify which.

See Index for Glover Air Hose Couplings—they save the air.

The "Jackhammer" Drill—BCR-430

An all steel, self rotating, hand hammer drill for holes of average size and depth. It will operate on either steam or air.

Requires 70 to 80 cubic feet of air or $2\frac{1}{2}$ to 3 boiler horse power.

Used for shaft sinking, trench digging and block holing. Owing to its ability to operate on steam, it is very popular with steam shovel and dredge operators for breaking up boulders ahead of the machine.

Coal miners find the Jackhammer far superior to ordinary hand augers for boring coal. It has the additional advantage that it may be used for ordinary rock drilling for development work.

The "Jackhammer" by reason of its high drilling speed and automatic rotation which entirely relieves the operator of the fatigue of hand rotation, far exceeds the ordinary type of hand drill. The rotation is also more positive, so that trouble experienced with rifled holes or steels sticking is materially reduced.

Its drilling capacity is usually sufficient to obviate the use of a tripod drill on intermittent work where shallow holes are required.

None but the very best materials enter into its construction, so that maximum stand-up qualities are ensured. All parts subject to wear are given special treatment and ground accurately to size.

It is equipped with the "Butterfly" valve and automatic lubrication.

Water "Jackhammer" Drill—BCRW-430

This is a standard "Jackhammer" equipped with a device for feeding water and air to the bit, through the hollow drill steel.

A water tube is mounted in the handle and passes through the rifle bar and piston into the shank of the drill steel.

This device absolutely eliminates the dust nuisance. Standard dry Jackhammers may be converted into water Jackhammers by substituting a few parts.

The water Jackhammer requires water at the drill under a pressure of at least 25 pounds. If water under pressure is not available, a tank can be furnished for connection to the air supply to keep the water under sufficient pressure.

J. C. 110 Jackhammer mounting

The mounting is designed to accommodate a standard Jackhammer, either the water type or "dry" type. It is very useful for flat-hole work, such as met with in drifting, underhand stoping, breaking down coal, driving small tunnels, etc. The Jackhammer is easily attached or detached by means of a simple clamping device. This feature makes it possible to use the drill both mounted and unmounted, without loss of time in making the changes.

The carriage is moved by a feed screw which is supported at both ends, these supports acting as stops to prevent the carriage from being fed out of the shell. The feed is augmented by means of a sliding cone, held in place by a clamp.

The JC110 mounting is adapted for use on either a column, shaft bar, or tripod, being fitted with a standard 5-inch cone.

C110—The Butterfly Rock Drill

Mounted on Tripod

The Simplest and Most Efficient Drill Made for Steam or Air
This is the latest and most up-to-date Ingersoll-Rand drill and is the fastest drill made of the reciprocating type.

Will drive holes in any direction, either up, down or horizontally. Good up to a maximum of 10 feet depth of hole.

The "butterfly" valve is simply a winged piece of steel. Its movement is as simple as that of a cartwheel; it is indestructible; its action is positive; it controls both inlet and exhaust and when open it instantly exposes a large port area. A new chuck is also furnished with this drill, which accelerates unchucking and saves time changing steels.

Little Tugger Hoists

"Little Tugger" hoists are a brand new idea in portable pneumatic hoists. They are the result of a close study of the needs of the mine manager and contractor for some quick and reliable means for hoisting and lowering machines, timbers and other apparatus.

The "Little Tugger" will move a load in the time required to rig up block and tackle or while a workman is collecting a gang of other workmen to give him a "lift." It is equally useful for hauling purposes.

They are wholly enclosed, no moving parts except the drum being exposed, self-lubricating, light and compact, powerful and easy to operate. Built in two sizes, each size can be supplied for operation on either steam or air. Unless otherwise specified the standard air operated hoist will be supplied.

Safety is provided by a powerful band brake operated by a hand lever. A clutch is provided for releasing the drum. Clutch, throttle and brake levers are readily accessible.

"Sergeant" Rock Drills (Type 24)

For Steam or Air

This drill has a wide variation of stroke, secured simply by "cranking" the machine forward, without any valves or other regulating devices. The blow is absolutely dead and no machine of same cylinder diameter can match it in its effective penetrating quality. The ability to run on a very short stroke is of great advantage when starting a hole in an oblique surface and in avoiding a glancing blow. It also admits of the hole being quickly started without "funneling" or "rifling." This feature is of vital importance when working through seams, in shelly or caving material where pebbles fall under the bit, in crevices or alternate layers of hard and soft rock. This drill also "muds" or cleans the cutting out of the hole in a most effective manner. Another valuable feature is in the fact that the valve action is not dependent upon the condition of the cylinder, piston or rings. It has an absolutely positive and independent valve movement. This is the best "all-round" drill made for contractors working in different sections of the country taking a drill from place to place. It is strong and rugged and there is nothing special about it. All bolts and threads are standard, and this drill is most economical in the matter of repairs and air consumption.

Prices on quarry bars, drill steels, sand pumps, B. S. tools, etc., quoted upon request.

"American" Improved Variable Friction Feed Saw Mills

These mills are light running, easy to install, and do not easily get out of order. The latest improved features are embodied in their design, which enables them to cut more timber than other mills using same power.

Variable Feed—Bevel frictions are used as drivers, insuring positive motion, reducing end and lateral thrust, and maintaining a wide range of feed variation. The "gig back" is also positive and will start on highest speed without any slipping; it is many times faster than the feed.

Husk Frames are made of selected timber, well bolted together and thoroughly braced. All shafts are turned and ground perfectly true, and run in self-oiling bearings throughout.

Carriages are of sufficient strength to withstand any reasonable load and hard usage to which saw mill carriages are usually subjected.

Trucks—On all carriage trucks are large diameter, fitted with steel axles running in self-oiling babbitted boxes, with ample provision for taking up all lost motion, and accurately turned to perfectly fit guide track.

Track furnished is rolled steel in 12-foot sections and furnished with suitable holding down spikes.

Set Works—We usually furnish patented combination set works and quick receder, which are accurate and possess many advantages. Two or three pulls of lever will recede the blocks as far as is usually required. We can also furnish the larger mills with double acting set works and spring or foot receder as may be ordered.

Carriage Drives—All standard mills are furnished with rack and pinion carriage drive, but manila or wire rope drive will be supplied, if preferred, with small additional cost.

Equipped with board roll spreader wheel and saw guide.

Standard mill is furnished with rack and pinion carriage drive. Wire cable drive furnished at additional price.

Larger mills quoted on application. Right hand mills furnished unless otherwise ordered. Mandrel pulleys of any size up to 24 inches in diameter furnished without extra charge if ordered with mill. Mills can all be furnished mounted on trucks. Prices quoted on application.

American Short Saw Mill and Bolter

With variable friction feed, which is light running, admits of wide variation and adapts the mill for light or heavy power.

Any kind of short log sawing, mine or railroad ties, fence posts, handle stock, shooks, slats, etc., can be handled on this machine.

By flitching a log into cuts of desired thickness and then placing several of these, one on top of the other, on the carriage, thin slats, laths, etc., may be made, several at one cut and very rapidly.

Regularly furnished with manila rope drive which is strong, quick in operation and allows carriage to travel the full length of the track. Wire rope drive furnished at extra cost.

Built regularly in two sizes as per specifications below.

No. 1 1/2 Mill

Husk frame 7x3 feet, timbers 3 1/2 x 7 1/2 inches.
Mandrel 2 1/2 inches with pulley 20x10 inches.
Carriage 8 feet by 30 inches, timbers 3 1/2 x 5 1/2 inches.
Trucks 3 with 7-inch wheels 1 1/4-inch axles.
Track and ways complete, 28 feet long.
Floor space required 28x10 feet.
Weight of mill complete, 3,000 lbs.
Weight of track ways only, 350 lbs.
Weight of foundation timbers, 450 lbs.
Weight of truck, if wanted, 1,000 lbs.
Weight of Mill complete, boxed for export, gross, 3,500 lbs.; net, 3,000 lbs.

Carriage..... 8 Ft. 10 Ft. 12 Ft.
No. 1 1/2 mill complete..... \$360.00 \$385.00 \$400.00

Mounting on four-wheel truck, \$155.00 extra. Foundation timbers, if not wanted, deduct \$12.00. Track way timbers, if not wanted, deduct \$17.50. Pulleys of any size furnished to suit speed of engine and size of saw. Extra charge made for pulleys over 24-inch diameter.

No. 2 1/2 Mill

Husk frame 7 1/2 x 3 1/2 feet, timbers 3 1/2 x 9 1/2 inches.
Mandrel 2 1/2 inches with pulley 20x10 inches.
Carriage 8 feet by 36 inches, timbers 4 1/2 x 6 1/2 inches.
Trucks 3 with 8-inch wheels, 1 1/2-inch axles.
Track and ways complete, 28 feet long.
Floor space required 28x11 feet.
Weight of mill complete, 3,700 lbs.
Weight of track ways only, 400 lbs.
Weight of foundation timbers, 500 lbs.
Weight of truck, if wanted, 1,000 lbs.
Weight of mill complete, boxed for export, gross, 4,500 lbs.; net, 3,700 lbs.

Carriage..... 8 Ft. 10 Ft. 12 Ft.
No. 2 1/2 mill complete..... \$445.00 \$465.00 \$490.00

Power Wood Saw Frames

No. 44 Wood Frame

Frame of seasoned timber, securely bolted and braced. Bearings are cast on a solid iron beam extending entire length of the frame which holds them in alignment at all times.

Table is of the swing type, pivoted at bottom on a cast bearing.

This frame can be used with saws 20 to 30-inch diameter. Speeds 1000 to 1500 R. P. M. Pulley 6x6 inches. Weight 250 lbs.

Price..... \$30.00

Price does not include saw blade.

No. 40 Steel Frame

Frame of steel and cast iron securely riveted and bolted together and strongly braced in every direction. Balance wheel is placed on an independent shaft directly under saw arbor, so that poles and long sticks can be sawed to best advantage.

Fly wheel shaft has adjustable bearings.

Frame can be used with saws 20 to 30-inch diameter. Speeds 1000 to 1500 R. P. M. Pulley 6x6 inches. Weight 360 lbs.

Price..... \$48.00

Price does not include saw blade.

33-Inch Pony Gang Edger

Full Length View From Feeding-out End

For small plants or mills cutting 5,000 to 15,000 feet per day this edger is practically indispensable—the increase in capacity and saving in waste soon pays for it.

Made with two or three saws, solid or inserted teeth, single or double pressure rolls, self-oiling shifter forks. Has quick acting ratchet guide and indicator always in view of the operator. Lever saw shift and ratchet to hold saws in position.

For light work, edging boards, etc., the single pressure roll edger is preferred by a good many operators.

Specifications: Floor space, 18 ft. 6 in. by 48 inches. Width inside, 33 inches. Guide adjustment, 4 inches. Mandrel $1\frac{1}{2}$ -inch diameter. Mandrel pulley 8x8 inches. Saws 14-inch diameter. Speed 1600 to 2000 revolutions per minute. Feed belt required is 8 feet long and 4 inches wide. Maximum opening between saws: Two saw edger is 24 inches; three saw edger, 20 inches. Shipping weights: Single roll, 1300 lbs.; double, 1400 lbs.

Two Saw Edgers

	Single Pressure Roll	Double Pressure Roll
Price without saws	\$156.00	\$174.00
Price with solid saws	166.00	184.00
Price with inserted tooth saws	198.00	216.00

Three Saw Edgers

	Single Pressure Roll	Double Pressure Roll
Price without saws	\$174.00	\$191.00
Price with solid saws	190.00	207.00
Price with inserted tooth saws	236.00	253.00

The rear section is detachable in shipping. Front section, including working parts, shifting lever and guide are shipped intact, legs only being removed. Entire machine crated and shipped in one package.

Fig. 490. 18-Inch Disk Grinder

A handy and useful machine for any pattern-shop, wood-working shop, or machine-shop. For use on wood, it will do work similar to a wood-trimmer, but will face off larger surfaces, and do it quickly and accurately. In a metal-working shop it will do a large part of the file-work at a saving of time and files. By using an emery wheel on back end in place of drum it makes a handy grinder. Machine will take emery wheel 10 inches diameter, 1-inch face, 1-inch hole. The table is adjustable for any angle from 45 degrees downward to 45 degrees upward, a graduated scale indicating the angle.

Dimensions

Diameter of disk	18 in.
Size of table	10x24 in.
Diameter and face of drum	6x5 in.
Width of belt for mandrel	3 in.
Size of tight and loose pulleys	8x3 in.
Speed of countershaft per minute	400 rev.
Floor space required, over all	24x27 in.
Shipping weight	475 lbs.
Horse power required	1 to $1\frac{1}{2}$
Price	\$80.00

Equipment. Each machine is equipped with two disks, one drum, one segment-stop, one angle gauge, and one countershaft.

Onoko Metal runs smooth and cool. Use it on your bearings.

"Champion" Friction Feed Drag Saw

The friction feed is positive and effective. Will start, stop or reverse instantly by a very slight motion of the feed lever without any effort on the part of the operator. This enables the operator to feed logs ahead or back and stop at any point without running back or losing time.

Main frame is 26 inches wide and $8\frac{1}{2}$ feet long, made of $3\frac{1}{2} \times 5\frac{1}{2}$ seasoned hardwood. Track is 27 inches wide by 16 feet long, made of $2\frac{1}{4} \times 4$ -inch timbers.

Balance wheel is counter-balanced, imparting a strong, steady motion and is arranged to change the stroke from 16 inches to 20 or 24 inches.

Saw is raised with one hand and the friction feed operated with the other, thus changing and setting for a new cut without slowing down or stopping. Saw guide is provided.

Two to four horse power will operate this machine to good advantage. More power will give greater capacity. Capacity is 30 to 40 cords of wood per day. Speed recommended is 125 to 175 strokes per minute. Shipping weight complete is 1150 pounds.

Price complete with one saw and pulley or universal coupling \$100.00

Price complete with one saw and tight and loose pulley 110.00

Price complete with one saw and without power feed 90.00

Knight's New Ideal Saw Mill Dog

Has improved locking mechanism, controlled by the power lever which automatically locks the dog bit at any point as it is forced into the timber.

The Duplex dogs the log from above and also below. The lower dog is entirely automatic in its action. No adjustment is necessary to bring it into proper position to hold either log or cant.

Directions for Ordering

To avoid delay and insure filling orders correctly, the following information should be given:

Size number, single or duplex, right or left hand. The hand may be determined as follows: On right-hand mills a right-hand dog is used on the front block and a left-hand on the rear or intermediate blocks. On left-hand mills a left-hand dog is used on the front block and right-hand on the rear or intermediate blocks.

Single, R. H.

Duplex, R. H.

Number	Height, Inches	Size Guide Bar	Size Slide Bar	Size Dog Bit	Weight, Pounds		Price per Pair

Automatic Sharpener For Relieved Tooth Metal Cutting Saws

For saws with alternating long and short teeth, now coming rapidly into use for fast, smooth cutting of metals enables better work and saves strain on the saws and saw expense.

No. 20 Automatic Sharpener for Metal Cutting

The Wallace Bench Planer

A powerful machine which takes the heaviest cuts in hard or soft wood, and makes a finish cut so smooth that knife marks do not show.

The motor driven type is run from a standard light socket. It is portable and stands on a bench without fastening.

Safety Guards. The flap and shutter guards are patented and can be gotten with no other planer.

The flap is an aluminum casting swinging over the tables, independent of the shutter, when special work such as rabbetting is done, it can be swung off the table. A spring holds it against the stock, so that the unused part of the knives is covered.

The Shutter is part of a steel tube which slides in grooves in the frame, concentric with the cutter head, and covers the throat opening.

The lip of the shutter rests on top of the front table until it is pushed by the stock around under the rear table.

A spring snaps the shutter back over the knives when the cut is finished.

Specifications

Width of cutting knives, inches.....	4
Length of front table, inches.....	10
Length of rear table, inches.....	8
Weight of planer with motor, pounds.....	50
Speed of 2-knife cutter head, R.P.M.....	4000
Speed of 3-knife cutter head, R.P.M.....	3600
Diameter of drive pulley, inches.....	9
Diameter of tight and loose pulleys, inches.....	4
Speed of countershaft, R.P.M.....	900

The Safety Guard. As described above.

The Frame. One piece, no parts to get out of adjustment.

The Cutter Head. Circular safety type, two or three knives.

The Tables. One piece; ground to a true surface. Adjustable to any depth of cut.

The Fence. Adjustable to any angle.

The Finish. All working parts accurately machined and interchangeable.

Price List

With pulley for belt drive and with countershaft.....	\$56.70

For Flap and Shutter Guard attached (see other side).....	12.00
Extra knives, special steel, each.....	1.30
Motors of other voltage and current priced on application; all motors direct connected.	

The Crescent Hollow Chisel Mortiser

The chisel is square, having a round hollow center, in which the boring bit revolves. The hole is bored and squared at the same time, and by repeating, a mortise of any length is made, with square ends and bottom.

The table is adjusted vertically and horizontally. The travel of bit is operated by foot lever, the maximum depth of mortise being $3\frac{1}{2}$ inches. The stroke is readily shortened to $2\frac{1}{4}$ -inch or less, for heavy work or shallow mortises. The machine runs smoothly without jar or noise. The slide of table and upper head have adjustable gibs to take up wear which adapts it for most accurate work.

The chisel cannot lift the work. The idler and loose pulleys are oiled from chambers in the shafts. The spindle bearings have large capillary oil-chambers.

Recommended for chisels up to $\frac{3}{4}$ -inch square for hardwood. When square chisel is removed, it is an efficient borer for round holes up to $\frac{3}{4}$ -inch diameter and $3\frac{1}{2}$ -inch deep.

Furnished with table to tilt to an angle of 45 degrees, to right or left, at an extra charge of \$40.00. A scale and pointer indicates the degree of angle.

This tilting table has rack and pinion horizontal adjustment, and clamps for holding work instead of the regular hold-down rods. It is not necessary to remove work until the entire length of mortise is completed.

Specifications

Length of table.....	30 inches
Vertical adjustment of table.....	9 inches
Horizontal adjustment of table.....	$3\frac{1}{4}$ inches

Jointers

Also Called Buzz Planers or Hand Planers

Used for straightening lumber. Will plane one surface straight and out-of-wind—and by use of the "fence" will bring one surface, on dimension stock, square with another, or on accurate bevel with another.

Not intended for surfacing boards to uniform thickness—for such use a regular planer or surfacer must be used.

By use of special cutters a jointer is often used for beading, grooving, making light moulding and other similar work.

Regular Equipment: Countershaft with self-oiling loose pulley, one fence, one pressure spring, one pair of knives, one jointer guard and one wrench.

Variety Wood Worker

Jointer, Saw-Table, Hand Feed Moulder, Borer, Pole-Rounder and Emery Grinder

It is usually advisable to buy separate machines for the different kinds of work, but when working space does not admit of this, or when there is not enough of each kind of work to justify the expense of separate machines, then a good combination machine may be an advantage.

The Jointer is covered by description of the 8-inch machine listed above.

Machine can be used as a jointer, borer or saw table without any adjustments or changes whatever, as these three features are practically independent of each other.

Saw-Table Attachment. Table is 12x30 inches, groover or dado head can be used. Saw is 10-inch diameter and will cut through pieces 2½ inches thick. Fence will open 12 inches from saw, table graduated on top to show width ripped—sliding cut-off gauge also furnished.

Pole-Rounder has a sliding yoke and can be used at same time as jointer. **Emery Grinder**, 5-inch wheel for light work. **Hand Moulder** is convenient for working small mouldings and other odd jobs.

Borer has a horizontal travel of 8 inches, vertical adjustment is 5 inches—has self-centering chuck.

Safety Guards furnished with each machine.

Hold-down Spring furnished; is useful when working small stock, light moulding, finished strips, etc.

Machine is usually sold with all attachments included. Deduction for various attachments see below.

Deductions

If saw-table is omitted, deduct.....	\$20.00
If Borer is omitted, deduct.....	20.00
If Pole-Rounder, Grinder and Moulder are omitted, deduct.....	20.00

Extras

For Safety Head, \$15.00; for steel Lips, add \$7.00.

Dimensions

Dimensions given below are for complete machine. If some of the attachments are omitted, it will make a corresponding difference in weight, floor space, etc.

Size of tight and loose pulleys.....	8x3 inches
Speed of countershaft per minute.....	800 revolutions
Giving head a speed per minute of.....	3650 revolutions
Width of belt, to head.....	2½ inches
Floor space over all.....	58x64 inches
Power required.....	2 to 3 H. P.
Shipping weight.....	1100 lbs.

Regular Equipment: With jointer is furnished one pair of 8-inch knives, one countershaft having self-oiling loose pulley, one fence, one hold-down spring, one steel wrench for knife bolts, one collar guard and one knife guard.

With borer, one self-centering chuck. (Bits are not included.)

With saw-table, one 10-inch rip saw, one mandrel wrench, one ripping fence, one cut-off gauge, loose collars to fill saw-stub and one saw guard.

With pole-rounder, two pole-guides, one pair of 2-inch straight knives, two pair of rounder knives (for 1-inch and 1½-inch radius), one mandrel wrench, collars to fill spindle, one moulder table, one pressure spring, one emery wheel 5x½-inch, and one grinding rest.

Price complete, as above.....\$200.00

Ajax Rope costs more than others, but for durability it is unexcelled.

Jewel Planer**16 and 20 inch**

Designed for small shops and those requiring a good light single surface planer for general work.

Simple and compact—has large capacity in proportion to its size—working hard or soft wood equally well and particularly adapted for planing short stock.

Has two power feed rolls, one in front and one in the rear of the cutter-head. The feeding roll is fluted to secure a strong, positive feed. Two speeds of feed provided through cone pulleys. Feed can be stopped or started instantly by means of a convenient belt tightener. Bed is accurately planed and fitted with two steel idler rolls.

The cutter head is accurately turned and balanced, its position is not changed for different thickness of lumber.

Built in two sizes—to plane 16 or 20 inches wide and from $\frac{1}{4}$ to 6 inches in thickness. Regularly furnished with one pair of planer knives. No belting with machines. Feed belts require $13\frac{1}{2}$ feet of $1\frac{1}{2}$ -inch belting.

16-inch Jewel planer, with countershaft, weight 720 pounds... \$160.00
20-inch Jewel planer, with countershaft, weight 745 pounds... 140.00
If countershaft is not wanted (weight 150 pounds), deduct... 20.00

Price each.....	\$200.00	\$230.00

Regular Equipment: Each machine is furnished with one countershaft, having self-oiling loose pulley, one pair of two knives and two wrenches.

A new feature of these planers is that they are provided with a variable friction feed, driven direct from the head with a belt. A slow feed, or a fast feed, or any intermediate feed is instantly available, and the change is made by simply turning a handwheel. The changes can readily be made while machine is in motion. The slowest feed is 12 lineal feet per minute, and the fastest, 50 feet per minute; a pointer and scale indicates the feed being used.

When the work to be done is of a common nature, a few turns of the handwheel will set the feed on high-speed, and a marked saving of time will result. Or when extremely smooth work is desired, a few turns of the handwheel, in the opposite direction, will set the feed on slow-speed, and the work produced will be of the desired smoothness. When the rough lumber to be surfaced is not of uniform thickness there is an advantage in using a slow feed for the thicker pieces; in this way it is not necessary to choke down the machine until belts begin to slip; simply reduce the feed according to the thickness of the cut being taken. The same will apply also for wide or narrow boards. In each case the feed is adjusted according to the work being done.

These advantages can hardly be fully realized until tried, but when once tried, will at once seem indispensable. A throw-off lever, at side of table, can be used for instantly stopping the feed entirely, without stopping the machine. The front upper roll is hung with weights.

No. 424 Variable Feed Planer and Matcher

The variable feed feature is the same as described for Nos. 218 and 224 Planers.

The front upper roll is hung with weights instead of springs, and the feed is driven by belt from head instead of being driven from the countershaft. The feed is readily changed; anything from 12 to 50 feet per minute, while machine is running.

The Head is suited for two planer knives; also slotted on the other two sides for attaching special knives for making molding, beading, siding, etc. There is a clearance of one-half inch for such cutters between the head and the chip-breaker and pressure bar.

The Matcher Heads are made of bronze, mortised to admit knives 2½ inches wide, ⅜-inch thick. They are suited for matching or edging up lumber either square or molded edges. By loosening a set-screw they are readily lifted from their spindles, and the end of spindle is entirely below the surface of the table out of the way for planing.

The Countershaft is placed to rear of the machine on the floor. It cannot be used in any other position. It should be placed at least 96 inches from center of head to center of countershaft. The length of belts and floor space given are based on this distance. The countershaft can be belted in any direction to line shaft and is provided with a convenient shifter.

The Change from matcher to planer is readily and quickly made, requiring but a few minutes' time.

Other Features. The lower rolls are adjustable for height, and for lateral alignment so stock can be made to feed through straight. The machine cannot be made double-belted, nor with lower rolls driven.

Dimensions

Width and thickness will match.....	12x2 inches
Minimum thickness will match.....	¾-inch

Length of 4-inch drive belt.....	19 feet 3 inches
Power required.....	4 to 6 H. P.
Domestic shipping weight.....	2,000 pounds
Price.....	\$380.00

Regular Equipment: Each machine is furnished with countershaft having self-oiling loose pulley, pair of two planer knives, pair of matcher heads, with knives for matching ¾-inch flooring, two steel wrenches and one wrench for holding matcher heads. No belts furnished.

Dimensions

Size of table (iron).....	36x36 inches
Height of table from floor.....	34 inches
Size of pulley on countershaft.....	10x5 inches
Speed of pulley on countershaft.....	800 revolutions
Speed of spindle, per minute.....	5,000 revolutions
Belt required for spindle (3-in. wide).....	14 feet 8 inches long
Diameter of spindle above table.....	1 inch
Floor space required, over all.....	36x108 inches
Power required.....	2 to 3 H. P.
Domestic shipping weight.....	1,000 pounds
Price.....	\$170.00

Regular Equipment: Reverse-motion countershaft, one pair of 2-inch plain knives, one guide-pin, collars to fill the spindle, two throat-collars, one wrench and one pin with chain to hold spindle.

No. 363 Single Spindle Shaper

The frame of this machine is cast in one piece, box pattern, with wide base, for stability and steady running.

The Table also is cast in one piece with heavy ribs and wide flanges, and being belted to the frame on planed-off surfaces, insures utmost rigidity and accuracy. The table has a 6-inch opening for spindle, fitted with throat-collars; one collar having 2½-inch hole, another having 3-inch hole.

The Spindle has collar welded on and pulley shrunk on. The bearings are 1¼ inches in diameter, 6 inches long. Spindle above collar is 1 inch in diameter, 7 inches long, and will take 4-inch knives between grooved collars. The spindle-travel, vertically, is 4¼ inches, and the spindle will extend 7 inches above table when up.

The Spindle Yoke is gibbed to the frame in adjustable dovetailed ways. It is raised and lowered by handwheel, and can be held at any point by a hand screw.

The Spindle Bearings are of high-speed babbitt, with liners to adjust for wear, have capillary felts for continuous oiling. The end-thrust bearing is made with a fiber step.

The Countershaft stands edgewise to the pull of the belt, which is the proper way—stands solidly. Has friction-cones for reversing the motion. The reversing-clutch, being on outside of frame is accessible, and will not waste oil onto friction-cones, as would be the case if placed under the cones. Loose pulley is not furnished on this countershaft, as it is preferable to let the horizontal shaft run when machine is not in use, rather than to leave a loose pulley run on the shaft.

Contractors' Portable Wood Worker

Self-Contained Power—Invaluable for Form Work on Concrete Jobs

With Gasoline Engine Built-in, Self-Contained and Portable

A Rip Saw
A Cut-Off Saw
A Miter Saw
A Dado Machine
A Boring Machine
A Rabbeting Machine
A Jointer or Planer
A Gaining Machine
A Grooving Machine
A Tenoning Machine
A Matcher
A Moulder
A Sander
All with Self-Contained Power

With this machine sawing, joining or planing, boring and scroll-sawing can all be done at once by four different men without interference or making any change in the machine.

Particularly adapted for contractors, carpenters, concrete workers and lumber yards and is intended to be used right on the job for doing a large variety of light and medium mill work.

The machine is compact, self-contained and very substantially built throughout of good materials and will stand hard, continuous service. Floor space 54x54 inches. Height 36 inches. Arbor takes 1-inch hole saws.

With 5 H. P. the capacity in 1½ lumber is 100 to 150 lineal feet per minute; in 2-inch 50 to 75 feet. Will rip 3-inch lumber easily and by feeding properly even heavier material can be worked. Will rip a board 26 inches wide through the center without removing the saw guide.

Frame is made of 3½x3½ hard wood accurately framed and bolted together.

The 30x54-inch iron table or top is of cast iron, well ribbed and accurately planed. It is hinged to the rear of the frame and raised and lowered by a hand screw. It is independent of the jointer table.

Adjustable ripping gauge is furnished which has tilting fence for bevel sawing also has rapid fine adjustment and locking device. It opens out to 14 inches from the saw.

The cut-off gauge slides in a planed groove extending the entire length of the table and can be set to cut squares mitres or any angle desired.

The jointer or planer is entirely separate from the top of the machine. It has a steel cutter head with two 6-inch knives and slotted on two sides to receive matcher bits or moulding cutters for working a large variety of shapes. This table is 7½ inches wide and 43 inches long and adjustable to any desired position. An adjustable fence is provided which tilts to any desired bevel for chamfering, etc. Jointer head is removable to permit the use of the sander drum. Boring table has a travel of 6 inches and vertical adjustment of 3½ inches. Arbor is 1½ and takes saws with 1-inch hole.

Regular Equipment consists of 5 H. P. gasoline engine or 3 or 5 H. P. electric motor built-in. The 5 H. P. gasoline engine is a simple water-cooled type with magneto, spark coil and connections, endless driving belt, rip and cut-off gauges, one 14-inch rip saw, one 14-inch cross-cut saw, one each ½ and ¾ dado head, one jointer head with two 6-inch knives, one each ½ and 1-inch auger bits, one sander drum and one sander disc, one emery wheel with arbor, one each throat piece for dado heads and saws, also oil can and wrenches.

No.	Style of Power Equipment	Weight, Lbs.	Prices
12	Complete with 5 H. P. gasoline engine built-in with magneto.....	1050	\$335.00
13	Complete with 3 H. P. D. C. motor, 110-220-500 volt.....	1100	315.00
14	Complete with 5 H. P. D. C. motor, 110-220-500 volt.....		340.00

16	Complete with 5 H. P. 60 cycle, A. C., 2 and 3 phase motor, 220-440-550 volt.....		310.00
17	Complete with 3 H. P., 60 cycle, single phase motor, 110-220 volt.....	1100	336.00
18	Complete with 5 H. P., 60 cycle single phase motor, 110-220 volt.....		380.00
19	Complete without power, no belt nor countershaft.....		190.00
	Countershaft for machine without power.....		12.50
	Deduct for hollow chisel mortiser-boring attachment, if not wanted.....		32.00
	Deduct for jig saw, if not wanted.....		15.00
	Deduct for magneto, if not wanted.....		10.00

For other Wood Workers' Tools, Saws, Jointers, etc., see index.

The Crescent Universal Wood-Worker Nos. 51 and 59

of these is swiveled, for turning. A tongue may be permanently placed, the machine does not rest on the casters, but each has a set screw which acts as a jack, lifting the machine off the floor, and supporting the weight on the casters.

There are five units to the complete machine, a band saw, jointer, shaper, saw table and borer. It is not sold with any of these omitted, except the bandsaw. Each unit has the conveniences and refinements of individual machines, and will admit the use of attachments commonly used with such machines. By using special attachments it is adaptable as a re-saw hand-feed molder, tenoner, panel-raiser, pole-rounder, disk, knife or plain grinder, and hollow chisel mortiser.

Equipment of Regular Machines

The parts belonging regularly to each machine are briefly as follows: The jointer is equipped with two knives, one fence, one hold-down spring, one jointer guard and one wrench. The shaper is equipped with a pair of 2-inch straight knives, two guide pins, collars to fill the spindle, two throat collars, one wrench, one hold-down spring, one hold-over spring, one short fence and one pin to hold spindle. The saw-table is equipped with one 12-inch rip-saw, one ripping fence and one cut-off fence. The borer is equipped with a self-centering chuck and sliding table. The band-saw is equipped with one Wright's guide, one plain guide, one brazing clamp, one brazing tongs and one saw blade. Leather belting is included, for driving each of the machines from the drive shafts on the machine. The main drive belt from line shaft to main drive pulley on the machine is not included. When machine is ordered with motor, a suitable starter is included.

Surfacer

8-inch Jointer

The Berlin Portable Woodworking Mills

The Heavy Machine

The main frame and self oiling bearings are cast in one piece and cannot get out of alignment. This frame is mounted on steel tubular legs attached to a hardwood skid.

The table top is cast semi-steel, machined true on top and has a wooden extension in rear. The top is 68x37 inches, is hinged to main frame and lowered by hand screw. The wooden extension can be raised for access to engine or motor from above.

The engine is of the four cylinder type water hopper cooled. It has a gear driven magneto with make and break ignition, enclosed crank case, vertical valves, and all gears run in oil.

The saw arbor is 1½ inches diameter, with 1¼ inches end for saw and is ground to a perfect fit. The pulleys and tight collars are shrunk on and machined afterwards.

Rip and crosscut saws are regularly furnished, 14 inches diameter, with the No. 5 electrical and gasoline outfits, and will rip outfits we furnish 16-inch saws to rip 6-inch dressed lumber. Engines are all equipped with magneto.

Dado Head

Berlin Portable Wood Working Mills

Solid Top Machine

The main frame and table top form one unit. The steel angle legs and lower steel frame, being securely bolted to the table, forming a very stiff all metal frame.

The table top is stationary, but the saw is raised and lowered by means of a handle and clamp screw. The adjustment is made instantly without touching the belt tightener. The main bearing is a solid yoke, and cannot get out of alignment.

The main frame is of heavy steel angles, with braces and corner plates as shown.

The table top is semi-steel, machined true on its upper face and sides, with grooves for cut off and ripping gauges. A wooden throat-board is put in the table top of sufficient size to permit a 16-inch saw to be used in any machine.

The engine is of the same type as used with the heavy machine and described on preceding page. The band saw is of heavy-duty type.

It has 24-inch wheels, perfectly balanced and rubber banded. It has a vertical adjustment of 6-inches by hand-screw. The top wheel has adjustments for tilting to proper angle, with spring take-up. The guide has an easy adjustable vertical movement. Saw guide is smooth-running and can be adjusted in any direction. We furnish one 3/8-inch saw with every band saw attachment. The side table can be tilted for cutting angles on the band saw. When not in use, entire band saw with bracket can be swung out of way of rip saw and other attachments. The band saw bracket is exceptionally heavy for a machine of this size. If band saw is not required, we furnish a jig saw of the usual type, an excellent attachment for light work.

Saws are regularly furnished 12-inch diameter both cross cut and rip and are fitted to a ground arbor.

No. 9 Iron Combination Saw Table

With "built-in" Countershaft and belt-shifter

This machine is adapted for use as a rip, crosscut, grooving or dado machine and makes a fine table for contractors, furniture factories, planing mills, pattern shops, wagon works or anyone needing a moderately priced table that will do accurate sawing.

Adjustable Table is of cast iron, strongly ribbed and planed true. Table is hinged to the rear of the machine frame and is raised or lowered by a hand wheel and screw to accommodate the different thicknesses of stock to be sawed. Saw opening is fitted with a throat plate, which can be removed when using grooving heads. Two grooves extend the entire length of the table to receive the sliding miter and crosscutting gauges.

Frame is cast one piece with extension for countershaft of length for good belt centers.

Countershaft is built-in, making machine self-contained—a good rigid construction—easily portable.

Arbor Bearings are long and lined with babbit. Arbor pulley is machined all over and perfectly balanced for smooth running.

Table is equipped with one adjustable bevel ripping gauge and two adjustable cross-cutting gauges. Maximum width 5 inches with gauge is 18 inches.

No. 10 Swing Cut-Off Saw

6½ Foot—for Saws up to 24-inch

Frame is cast in one piece, cored out hollow. The mandrel has pulley shrunk on solid. Mandrel bearings are 1½-inch diameter by 5 inches long—self-oiling, capillary. Hangers are adjustable, frame is hung to the hangers in such a manner that it is impossible for the weight of the frame to ride on the shaft, insuring shaft working freely and easily.

The belt shifter is conveniently arranged—the belt cannot creep from one pulley to the other and shifter handle is in easy reach. Shifter is reversible, so that machine can be belted to line shaft either in front or rear. Loose pulley is self-oiling.

Dimensions

Size of mandrel pulley, inches.....	5x5
Size of tight and loose pulleys, inches.....	10x5
Speed of countershaft, R. P. M.....	560
Making speed of 18-inch saw, R. P. M.....	2000

Size of hole in saws, inches.....	1½
Horse power required.....	2 to 4
Shafting weight, pounds.....	450
Price.....	\$45.00

Regular Equipment includes one saw-shield 18 or 24-inch, one mandrel wrench and belt shifter. No saw or belt.

Special.—To order can furnish 5½, 6, 7, 7½ or 8-foot (measured from ceiling to mandrel) or machine with wall brackets, or 24-inch saw guard instead of 18-inch regular. All without extra charge.

Dado Head

Can be Used on any Circular Saw Mandrel

For cutting any width groove $\frac{1}{8}$ to 2-inch or over. This groove consists of two outside saws each of which is a groover itself, and as many inside cutters as is required.

The inside cutters are $\frac{1}{8}$, $\frac{1}{4}$ and $\frac{1}{2}$ -inch thick, so that any width of groove in 16ths of an inch may be cut.

The outside cutters are $\frac{1}{8}$ -inch thick.

A perfect groove can be cut with or across the grain, and will not leave a rough edge.

Special sets made to cut from 2 to 8 inches wide.

In ordering, please state the number of set, or greatest width of groove to be cut, diameter of groover and size of hole wanted. Extra inside cutters can be had at any time.

Mortising Chisel

Mortising chisels for sash are usually furnished in the pattern illustrated above. The sash mortising chisel has $4\frac{3}{4}$ -inch blade and is about $6\frac{1}{2}$ -inch overall.

The taper of the shank varies on tools required for different makes of machines.

To secure accurate fit the dimensions should be taken with a micrometer caliper.

When ordering it would be better to send a sample shank. Otherwise, carefully state size of the mortiser and name of maker.

Sizes $\frac{1}{4}$, $\frac{5}{16}$, $\frac{3}{8}$, $\frac{7}{16}$, $\frac{1}{2}$, $\frac{9}{16}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$, 1-inch. Price each\$1.50

Hollow Chisel and Bit

These chisels are of the finest and toughest tool steel obtainable. They are forged and finished by skilled workmen and are tested to accurately fit the tool holders of the particular type of machine in which they are to be used.

The hollow chisel bits are carefully proportioned for strength and easy cutting, with a twist to remove the chips rapidly.

We can supply these tools for hollow chisel mortisers of any make.

Prices on application.

Scroll Saw Blades

Scroll saw blades to fit the No. 2 and No. 7 Barnes scroll saw listed on another page.

They are 7 inches long and come in different widths, ranging from $\frac{1}{16}$ to $\frac{1}{4}$ -inch.

Price per dozen\$1.00

36-inch Saw

Power Band Saws

45 degree Angle Tilting Tables;
Patented Upper Wheel Bearings;
Wright's Anti-Friction Saw Guides;
Split Babbitted Bearings with Liners
Adjustable for Wear.

Quick Acting, Locking Device and
Angle Scale.

The 36-inch machine is the standard
size used in planing mills, factories and
pattern shops.

The 32-inch is for factory or general
planing mill use, and the 26 and 20-inch
for smaller work.

32-inch Saw

The following description applies in a general way to all sizes except the 20-inch. Owing to its small size this machine is somewhat differently constructed, having a special upper bearing without the spring tension—in other respects it is about the same as the larger machines.

The Main Frames are cast in one piece, cored-out hollow, of rectangular section.

The Upper Bearing arrangement is a vital part of the machine—upon it hangs the weight of the upper wheel plus the tension of the saw. The upper wheel is fastened to the shaft which revolves in a long split babbitted bearing adjustable for wear. The wheel can be raised or lowered or inclined backward or forward while the saw is in motion. Pivot bracket is fastened to the sliding head by two bolts in slotted holes—when bolts are released, the upper wheel can be given sidewise alignment with the lower wheel—called cross-line adjustment.

A spring near the back end of upper shaft holds bearing in proper position, preventing back-lash to the upper wheel should the saw break. The head that slides on the upright standard has steel gib and is adjustable for wear. The tension spring is telescoped over the raising screw and located inside of the frame where it does not show—this spring acts quickly, being free from inertia—no loose weights to get lost.

Tilting Tables provided on all machines. Table segment works on machined tongue and groove, has graduated brass scale and pointer degree of angle up to 45 degrees—held in any position by eccentric locking lever.

Iron Wheels are carefully turned inside and outside of rim and properly balanced. Solid rubber tires are vulcanized to the face of wheels. Belt Shifter arranged with handle under the sub-table.

Lower Shaft runs in a long bearing that is bolted rigidly to the frame of the machine, bearing is split and babbitted and adjustable for wear. Loose pulley is self-oiling from reservoir in hollow end of shaft.

Wright's Anti-friction Saw Guides are furnished for above the table—plain guide for below table.

Regular Equipment.—Includes saw guides, one pair brazing tongs, one brazing clamp and one saw blade of size stated in above table or will furnish any width up to 1 inch without extra charge.

Extras.—For foot power attachment 26 and 20-inch belted saws, \$8.00. Wright's saw guide below table instead of plain guide, \$5.00. Ripping gauge or fence, \$10.00. Resaw gauge for hand feed, No. 1 for 26-inch and smaller, 60 pounds, \$16.00. No. 2, for 32-inch and larger, 100 pounds, \$20.00. **Safety Devices.**—Saw guards, upper and lower, stationary, pressed steel with attaching brackets for all except 20-inch, \$8.00. Iron enclosing door for lower wheel and regular guard for upper, including dust spout for blower for 36-inch saws only, \$40.00.

No. 4 Circular Saw

A very strong and rigid machine of first class construction throughout. Designed for carpenters, cabinet makers and woodworkers in general.

The table is 28x30 inches, made of iron and planed perfectly true.

It can be used as a circular rip saw with self feed which can be regulated for hard or soft, thick or thin lumber.

It can be used as a cross cut or rip saw. The rip saw self feed can be regulated for hard or soft, thick or thin lumber and is self-adjusting for varying thicknesses. The self feed and rip saw gauge can be instantly thrown back, leaving the table perfectly clear for cross cut work. The cut off gauge can be set at any angle, and the speed can be readily changed for cross cut or rip sawing.

It can be used for rabbetting and grooving, and the high speed of cutter heads insures smooth, clean cut work. Cutter heads are also used for graining and dadoing and with knives of suitable widths for jointing. The rip saw feed may also be used for grooving and rabbetting.

The table can be adjusted up and down to regulate the depth of groove and rabbet. A 10-inch saw will

cut 3½-inch and a 12-inch saw up to 4½-inch thick lumber. The machine is also furnished with special boring attachment as shown below.

The special universal mitre gauge especially adapts it for picture frame makers or other work requiring accurate joints. Both ends of a joint may be cut at same time and if desired the moulding may be bradded while in the gauge.

Price List

No. 4 circular saw, complete with self feed and two 10-inch circular saws (one rip and one cut off).	Price \$60.00
Same as above, except countershaft for steam instead of foot power.	Price 65.00
Boring attachment	Price 10.00
Countershaft and belt pulley.	Price 10.00
Universal mitre gauge.	Price 10.00
Weight, 400 pounds. Crated for shipment, about 500 pounds.	

Combined Circular and Scroll Saw

A circular saw with scroll saw attachment, which may be furnished without the scroll saw as shown. The capacity of the scroll saw is the same as No. 7 on following page, and the guarantee with that machine applies equally to this.

For light sawing and general work this machine with its attachments is invaluable to any woodworker.

Neither the circular or scroll saw interferes with the operation of the other.

All kinds of joint work done accurately and rapidly. Table has vertical adjustment for depth of cut.

Saws are 6-inch diameter, 1½ inches above the table. 8-inch saws can be used.

Size of table, 28x30 inches. Shipping weight boxed, 350 pounds.

Price List of Combined Machines

Combined circular and scroll saw and boring attachment, including two circular saws, twelve assorted scroll saws, the boring attachment, with self-centering drill chuck.	\$67.00
Combined circular and scroll saw, including two circular saws and twelve assorted scroll saws.	\$53.50
Circular saw alone, one rip and one cross cut.	\$47.00
Scroll saw attachment only, including twelve assorted scroll saws.	\$6.75
Boring attachment, including "Old Reliable" self-centering drill-chuck.	\$13.50

Countershaft for steam power (2x10 pulleys, speed 200 R.P.M.)... \$13.50

When countershaft is taken in place of foot power, add \$5.00 to above list price.

Combined Circular and Scroll Saw. Scroll Saw Attachment not Shown.

Special Boring Attachment for No. 4 and Combined Machines. Price \$10.00.

Hand Circular Rip Saw

Will rip soft and hardwood boards up to 3½-inches thick and 19-inches wide.

The work is as true and square as that done by power saws, and is as easily dressed with the plane. An operator with ordinary endurance can easily rip (line measure) 600 feet of one-inch pine per hour. Can be easily arranged for cutting Rabbits, bevels, Tenons, etc. Saws 10-in. diameter, weight 190 pounds. Boxed for shipment 290 pounds.
Price.....\$54.00

Foot Power Mortiser

Efficient, Compact, Durable

The table can be set at any angle. All necessary adjustments made easily and quickly. The spring is of special coiled steel wire, and can be readily adjusted to give any required tension.

Weight 135 pounds, boxed for shipment 170 pounds. Price, \$27.00. We make ten sizes of chisels, price \$1.30 each, extra.

Hand Tenoning Machine

Cuts tenons up to three inches long. By repeating any length can be made. Works on pieces up to 2 x 12-inches, and can be adjusted to gauge the length, thickness and shoulder. It will not cope a shoulder, but will cut one farther back or deeper than the other, or both alike. One or both sides of the tenon are cut at once, cuts true, smooth, square shoulders, and can be set to cut tenons of uniform thickness or distance between shoulders. A hand machine which cuts as perfect tenons as a power machine. Price, \$33.50, weight 100 lbs.; boxed for shipment, 140 pounds.

Foot Power Former

For moulding brackets, scroll work, panel work, regular and irregular mouldings of up to ¾-inch, speed of the knives from twenty to twenty-five per minute insuring rapid and smooth work. They are operated in either direction. The spindle and its bearings are steel with adjustments to take up wear and all parts are strong and serviceable. Weight of machine 80 pounds, boxed for shipment 110 pounds. Price without knives \$27.00.

Scroll Saw No. 7 Stand Up Foot Power

This machine is designed for practical service in the workshops of carpenters and builders, cabinet makers and other wood workers.

It is guaranteed to be well made, of good material and workmanship, and with reasonable practice to saw at the following rates: Pine, 2 inches thick, 1 foot per minute; 1 inch thick, 4 feet per minute; walnut, 3 inches thick, $\frac{1}{2}$ foot per minute; 1 inch thick, 2 feet per minute, and other woods and thicknesses at proportionate rates.

The ordinary rate of speed when sawing is from 800 to 1200 strokes per minute. The saw leaves the work as smooth as is possible for any saw to do, and can be taken out and replaced in an instant for inside work.

The swing around the blade under the arm is 24 inches.

The length of the blade is 7 inches.

The table and arms are made of hard maple.

The frame is made of cast iron, strong, yet light.

The balance wheel runs on a steel arbor.

The machine weighs 60 pounds.

Boxed for shipment, 95 pounds.

We include one dozen blades with each machine.

Price, complete with foot power\$20.00

We can also furnish the No. 7 scroll saw arranged with a countershaft. The price of countershaft, including the connecting band wheel on the machine is \$13.50. The price of No. 7 scroll saw, arranged with countershaft only (no foot power), is \$27.00. No belting furnished with power saw.

Speed of countershaft 500 R. P. M. Tight and loose pulleys 4-inch diameter x 2-inch face.

Scroll Saw No. 2 Velocipede Foot Power

This machine has about the same capacity as scroll saw No. 7, warranty as to what that machine will do applying equally to it, but this is preferred by many on account of the velocipede foot power, and because of its having a boring attachment to open for inside work.

The swing around the blade under the arm is 24 inches.

The length of blade is 7 inches.

The table and arms are of hard maple.

The frame is of cast iron.

The balance and drive wheels run on steel arbors.

The machine weighs 90 pounds.

Boxed for shipment, 130 pounds.

We include one dozen blades with each machine.

The boring attachment can be furnished at any time if not desired when machine is ordered.

Price per No. 2 scroll saw without boring attachment.....\$24.00

Price No. 2 scroll saw with boring attachment..... 27.00

One $\frac{3}{8}$ bit is included with the boring attachment. We can furnish extra bits at the following prices each: $\frac{1}{16}$, 15c.; $\frac{3}{32}$, 15c.; $\frac{1}{8}$, 20c.; $\frac{5}{16}$, 20c.; $\frac{3}{16}$, 25c.; $\frac{1}{2}$, 30c.; $\frac{3}{4}$, 35c.

Electric Fans

Oscillating Desk or Bracket Fan—Gear Type 12 inch and 16 inch Sizes

These electric fans are made from the best material in every detail of construction, both electrical and mechanical. They are made with tools and gauges on the American interchangeable plan and should any part need replacement, a new part may be obtained by giving the number of the fan motor, and with absolute assurance of a perfect fit. The reduction mechanism is enclosed in an oilproof box filled with non-fluid oil. The worms and gear wheels are large in their proportions, accurately machined and substantially supported in bearings. The ends of the connecting rod are provided with hardened steel bushing which practically eliminates wear at any point. Fan can be made stationary by a slight operation, if desired. Made with highly efficient motors. For further particulars as to the motors, see the table below. Can furnish 8-inch fan if desired.

12 Inch Desk Position

Direct Current

No.	Diameter Blade, Inches	Volts	Price Each
1128	12	110	\$34.00
1129	12	220	36.00
1131	16	110	40.00
1132	16	220	42.00

Alternating

1153	12	110	\$36.50
1154	12	220	38.50
1159	16	110	43.00
1160	16	220	45.00

Alternating Current Swivel and Trunnion Desk or Bracket Fan

Designed with highly efficient type of winding that eliminates the centrifugal or automatic switch and gives a wide speed range. The type of winding employed also assures freedom from burn-outs, even though the motor should fail to start from any cause whatever. The body of the motor is symmetrical in appearance, avoiding deep recesses or projections, which tend to collect dirt. The bearings are accurately finished throughout, thereby securing perfect alignment. They are convertible into wall bracket fans without the use of an adapter thus making them universal desk or bracket fans. The switch base is exceptionally strong and will not crack under ordinary strain. The base of the motor is marked "Off, 1, 2, 3," indicating the different speeds. Can furnish 8-inch fan if desired.

Direct Current

No.	Diam. Blade, Inches	Volts	Cycles	Price Each
1500	12	110		\$27.00

1411	16	110	60	34.50
1412	16	220	60	36.50

12 Inch Wall Bracket Position

Six Blade Residence Fan

The Residence Type Fan is a type particularly adapted for home use. It is lighter than cast iron on account of its steel construction, yet it will not creep across the table or ledge on which it may be standing. It has a very low center of gravity, making it practically impossible to tip over. Has six blades, giving a wide distribution of air, runs quietly and has three speeds. This type is also well adapted for office use.

No.	Model Specifications	Price, Each
2104	Model 21 A. C. 110 V. 60 Cycle Desk	\$31.00
2200	Model 22 D. C. 110 V. Desk	29.00
2404	Model 24 A. C. 110 V. 60 Cyc. Osc.	38.50
2500	Model 25 D. C. 110 V. Oscillating	36.00

Small Exhaust Fans

For ventilation, removing smoke, dust or objectionable odors, these exhaust fans are frequently installed. Intended for mounting in walls or partitions and exhausting into open space (free air). Can be mounted in ceilings, but will require an end thrust at a slight extra cost. The motor blades and fans are the same type as described above. When working against free air the 12-inch fan will displace from 1500 to 2000 cu. ft. of air per minute, the 16-inch from 2200 to 3300 cu. ft.

General Electric Automatic Control Equipment

CR 2303 Self Starter and CR 2920 Pressure Governor used on a closed tank system

We are prepared to furnish a complete line of automatic control equipments for either A. C. or D. C. motors. This equipment is of extremely rugged construction, having withstood for years service such as is found in steel mills. On account of the variation that is found in automatic equipments, it will not be possible to give prices. Complete information relating to the automatic operation that is required, giving the complete rating of the motor that is to be controlled, whether it is to be controlled from a remote point by means of push button station, by pressure governor or by float switch. Some idea of the cycle of operation is required, i. e., whether the outfit will be required to start several times an hour or only once in five or six hours. The voltage and frequency of the circuit on which the equipment is to operate must be given and if these vary above and below normal the amount should be mentioned. If the equipment is not to be used with a G. E. motor, the complete rating should be given and in the case of A. C. motors the secondary current and voltage between rings. Peculiarities of installation, such as moisture and dirt, long supply mains of small capacity, small generator, or transformer capacity should be mentioned.

Electric Motors

General Electric—Type RI Single Phase A. C. Motors

Automatic starting type, requiring no external starter. They have interchangeable voltage connections, permitting their use on either 110 or 220 volt circuits. RI motors are especially adapted for heavy starting duty. They accelerate in from two to five seconds from standstill. They do not spark; have high efficiency; high overload capacity and will produce from 250 to 275 per cent of full load torque at full speed. Prices cover complete motors arranged for belt drive. Rockwood paper pulleys are furnished. Motors are for use on 60 cycle circuits only. 25 and 40 cycle motors can be furnished at special prices.

1	1200	4 1/2 x 2	196	204.00	5	1200	5 1/2 x 4	580	508.00

*Do not need sliding base; have slotted feet.

General Electric—Type KT & KQ 3 and 2 Phase—60 Cycle—Small AC Motors

These motors are of the squirrel cage type, the stator frame being of riveted construction with exposed laminations, permitting efficient cooling and giving a rugged construction with a pleasing appearance. No starter is required with these motors, but we recommend their installation with a G. E.—C. R. 1038—motor starting switch or an oil switch having inverse time limit overload relay coils. Price covers complete belted type motors wound for 110, 220, 440 or 550 volt, 60 cycle circuits.

These motors can be furnished in vertical, back geared or totally enclosed construction at special prices. They can also be wound for service on 25 or 40 cycle circuits at special prices.

*Do not need sliding base; have slotted feet.

Accidental closure impossible. A push opens and a pull closes the switch.

General Electric CR-1038 Motor Starting Switch

For throwing small alternating current motors directly across the line. Capacity 3 H. P.—110 volts; 5 H. P.—220 volts; 3 H. P.—440 and 550 volts. Provides protection from overload from single phase operation and accidental closing of switch. The handle can be locked against operation or the cover can be locked shut. The operator is protected from shock or burn.

The price covers the switch complete with two protective plugs and two extra fusible links. The only renewable part required is the fusible link. These can be supplied at \$0.65 per dozen. Padlock and two keys can be furnished at \$1.15 extra. Price complete. \$16.00

ELECTRIC MOTORS

General Electric Type KT and KQ 3 and 2 Phase—60 Cycle
Large A. C. Motors

This is the continuation of the line of small alternating current motors. In the large sizes it is necessary to provide some form of starting device, as the current taken from the lines becomes excessive in motors larger than 5 H. P. The prices below therefore include in addition to the motor, sliding base and pulley, a Type CR 1034 form H-2 starting compensator provided with low voltage release attachment, fuse panel and fuses. Overload relays can be substituted for fuses at an additional price of \$30.00. These motors can be furnished in back geared or vertical construction and they can be wound for 25 and 40 cycle circuits. The following prices cover 220, 440 and 550 volt motors. Other voltages and other speeds at special prices.

General Electric Slip-Ring Induction Motors

Constant and Variable Speed Types

The constant speed slip ring induction motors are for use where heavy starting duty is required, for instance in such application as the drive of reciprocating pumps, air compressors, rock crushers or concrete mixers. The prices include in each case a drum controller and resistance for 2 minute starting duty. The variable speed motors are for the drive of machine tools, fans, centrifugal pumps, etc., in cases where it is desired to operate at speeds reduced from normal. Prices in each case include a controller and resistance providing 50 per cent speed reduction.

Drum Controller

Note: Prices marked *do not include drum controller. Use 1261 controller for these ratings.

Steam Operated Direct Connected Generating Sets

Direct Current—250 Volts or Lower—Automatic Self-Oiling—Enclosed Vertical Engines.

This complete lighting set is exceptionally rugged, compact and low in operating cost. All working parts are accessible and adjustable. Originally designed for the U. S. Navy as a machine that would operate constantly with practically no attention except replenishing the oil reservoir. All bearings are very large, assuring smooth and constant operation. We have sold these outfits for many years for lighting dipper dredges and excavators, for marine and mill work and for isolated lighting plants of every kind.

The ventilation is unusually good and the machines will safely stand 25% overload without overheating.

The engine as well as the generator is made in the same shop—making a complete balanced unit.

The Engine is of the enclosed self-oiling type with oil pump in the base, except on the 2½ K. W. size which has a gravity multiple feed oiler.

Oil is pumped from oil reservoir in the base to sight feeds which lead to distributing trough on inside of engine frame—from here oil pipes lead to all movable bearings which are grooved for proper distribution of oil.

Oil is then drained back into the base where it is filtered and pumped.

A Water Shed Partition is provided to prevent the oil from coming in contact with the hot cylinder and causing it to carbonize.

The removable side doors, on each side of the engine frame allow ready access to the cross-head wrist pin and all adjacent parts while the hand hole plates give access to the lower end of the connecting rod.

Valve is of the balanced piston type with removable bronze valve chamber bushings.

No. 86 Machine, 3½ Kilowatt

Crank shafts are counterbalanced on all sizes 5 K. W. or larger.

The Generators are of the multipolar type, compound wound for 110 volts, unless otherwise specified. The shunt and series coils are separate and form wound, are made of very best double cotton covered magnet wire and thoroughly insulated.

The Armature is of the iron-clad ventilated type, with laminated core, built of electrical sheet steel, japanned before assembling. The drum and core are provided with air ducts, permitting a thorough circulation of air through same. The commutator is exceptionally heavy, insuring years of constant operation without renewal—it is built up on a separate sleeve and bolted to the armature drum, so that the shaft can be removed without disturbing the windings.

The engine crank coupling is coupled direct to the armature drum, dispensing with coupling on the armature shaft—a very desirable feature. Nothing but the finest double cotton covered magnet wire of the highest conductivity is used and the insulation is waterproof.

Testing and Guarantee.—Every generating set is run and carefully tested under full load before shipment and guaranteed to be in perfect working condition—we further guarantee the rating, stability and performance of these machines—besides the usual guarantee of freedom from defects in material and workmanship.

Switch Boards are not included in prices below. We can supply a plain stock board at an extra price—equipped with one voltmeter, one ammeter, one D. P. S. T., polished main switch, three branch switches, rheostat mounted, pilot lamp bracket, ground detector lamp receptacles, complete with fuses, bus bars and rear connections and with wall braces or angle iron frame as desired.

Price includes Lubricator, necessary Wrenches and front of board Rheostat.

Generators are always furnished compound wound, 110 volt unless otherwise specified.

Small Steam Driven Electric Generators

Your Dark Troubles Made Light
on the Night Shift

One of the neatest, most reliable and simplest lighting plants ever offered. It is of the highest quality in every detail of material and workmanship.

It is designed for constant hard service, is compact, self contained and durable. A very desirable unit for contractors, boat owners, etc.

The 1000 watt outfit is only 29 inches long, 17½ inches high, 16 inches wide and weighs 280 pounds; other sizes are in proportion. Furnished in two types, 110 volts and 32 volts. We recommend the 110 volts where the lighting currents are long and it is desired to use standard lamps. Search lights and projectors are all designed for 110 volts.

The 32 volt generator is recommended for short lighting circuits and where the lamps are subjected to a great deal of vibration as on steam shovels, locomotive cranes, dredges, ditchers, etc., as the lamp filaments are more rugged and stand up better.

Excepting the armatures, field coils, brushes and brush holders the construction of each type is the same and all parts are interchangeable.

Prices of Turbine Generators Only

32 VOLTS				110 VOLTS		32 or 110 VOLTS
300 Watt \$240.00	500 Watt \$250.00	1000 Watt \$260.00	2500 Watt \$380.00	1000 Watt \$270.00	2500 Watt \$400.00	1500 Watt \$270.00

Construction and Wrecking Lights

Designed to take the place of the more expensive search lights or projectors as its light has a greater spread it is better adapted to many conditions than the search light. Lighting larger areas, it is especially suitable for lighting large construction jobs, etc. The light spreads at an angle of 90 degrees at the lamp and clearly lights a field of 500 feet or more. When lighting a large field two or more lights may be used. This arrangement eliminates all shadows. Its construction is simple, neat and compact, nothing to get out of order.

Only one concentrated filament Mazda lamp is used and the best of workmanship and material is employed in its manufacture.

Owing to its simplicity and great adaptability it is indispensable on all kinds of excavating and construction work.

The light is instantly trained to new positions without wire changes.

Furnished either for 110 or 32 volts and can be used on either direct or alternating current circuits.

Prices and Specifications of Lights

Type	Size Incandescent Lamps Used Watts	Depth Lamp	Price without Incandescent Lamp
D-1	200	10½	\$74.00
D-1-M	400	10½	76.50
D-2	200	12½	74.00
D-2-M	400	12½	76.50
D-3	200	14½	74.00
D-3-M	400	14½	76.50

D-1-M, 2-M, 3-M have mogul screw socket, other medium screw base. Lamps are all 28½ inches high, 20 inches wide and weigh approximately 41 pounds.

Prices and Specification of Incandescent Lamps

Size Lamp Watts	Volts	Bulb	Type of Lamp Base	Price Each
200	105-130	G-30	Medium Screw	\$ 5.40
250	220-250	G-30	Medium Screw	6.50
250	32	G-30	Medium Screw	6.00
400	110-130	G-40	Mogul Screw	9.00
500	220-250	G-40	Mogul Screw	13.00

The focusing device on any of our flood lights permits the use of smaller lamps, which can be accurately focused. Adapters can be furnished for mogul sockets so smaller lamps can be used.

Isolated Service Storage Battery Electric Plants for Country Use The Isolated Electric Plant

Until very recently the use of electricity has been a city luxury. The development of the gasoline engine and the storage battery made the service of the isolated plant equal to that supplied by the central station. The tungsten lamp with its low current consumption, reducing the capacity of battery and size of engine and generator required and the use of low voltage lamps, reducing the number of cells of storage battery required, have brought the price of the plant within the reach of the average house owner of a farm or country home.

The lighting plant described on this page is distinctly of the unit type. The engine, generator and switchboard are all mounted on a permanent sub-base of iron and steel. The drive is by means of a special dynamo belt over an idler pulley. This pulley is flanged, making it impossible for belt to slip off and being counter balanced, this pulley always keeps belt at the proper tension regardless of stretch and at a wrap of full 180 degrees on both engine and dynamo pulley. The result is a perfect elastic belt drive, leaving engine free to drive other machinery if desired. A gasoline electric generating set so compact as to equal a direct connected unit with none of its disadvantages. Space and installation work is reduced to a minimum. The plant goes out to the user practically ready to run.

**Shipped
Ready
to Run**

After testing at factory, switchboard is disconnected and packed separately.

The balance of the machinery is crated as it stands and is "ready to run when the crate is removed." The battery is shipped fully charged.

The Storage Battery

The storage battery used was designed to supply a demand for a battery which would give good service for isolated lighting plants, and at the same time would not require installation by an expert. The plates used are made in exactly the same way, only on a smaller scale, as those used in the batteries adopted by central stations throughout the country. The batteries are of the well known Hyray Exide, sealed, rubber jar type and are shipped already charged, so that there is no installation cost on the batteries.

The Gasoline Engine

The gasoline engines are of the four cycle hopper cooled, bit and miss governor, jump spark type. Engine is especially well balanced and of high speed making it particularly fitted for this class of work. All bearings are of tobain bronze, interchangeable and removable at slight expense. All machine work is done to micrometer size. It is not built to meet competition in price, but designed for exacting service of private utility plants.

The Switchboard

The switchboard is designed to give a full twenty-four hour service, as lights may be used while the battery is charging. It is also possible to obtain the combined capacity of generator and battery. When lights are being supplied by the generator, the battery is "floated on the line" thus giving absolutely steady lights.

The instruments are mounted on 15-inch electrical slate. Circuit breaker is automatic and all switches are normally closed making board not only semi-automatic, but as simple and as nearly inexperience-proof as possible. Charge and discharge rate is indicated by a high class Westor type ammeter and storage battery capacity is at all times correctly indicated by an ampere hour meter, enabling operator to tell at a glance just how much in amperes is contained in the batteries.

No. 100F Electric Plant

Below will be found the specifications and prices of the No. 100F Electric Plant. We can furnish eleven other sizes ranging in price up to \$1140.00 Correspondence regarding these plants is invited.

Capacity of Plant No. 100F 32 Volt

From battery, fully charged, rated in Tungsten lamps at 14 Watts per Candle-Power:

Ampere Hours 44	Watt Hours 1408
For 3 hours 16 lamps 16 C. P. or 38 lamps 8 C. P.	
For 5 hours 13 lamps 16 C. P. or 26 lamps 8 C. P.	
For 8 hours 9 lamps 16 C. P. or 18 lamps 8 C. P.	

From dynamo and battery operating together, battery fully charged, dynamo rated at 12 lamps of 16 candle-power or 24 lamps of 8 candle-power.

Ampere Hours 50 1/4	Watt Hours 1658
For 3 hours 31 lamps, 16 C. P., or 62 lamps 8 C. P.	
For 5 hours, 25 lamps, 16 C. P., or 50 lamps 8 C. P.	
For 8 hours, 21 lamps, 16 C. P., or 42 lamps 8 C. P.

Four Cylinder 5x6 24 H. P. Engine

Flywheel is bolted to a solid flange on the crankshaft, and the main and lower connecting rod bearings are lined with interchangeable Parson's white bronze bushings. Cranks and rollers are of hardened tool steel and with all gears are enclosed in crank case. Adjustable steel push rods work in extra long key-seated bronze guides. All parts are easily accessible. Intake valves operate mechanically and are on side of cylinders opposite exhaust valves. A special Paragon reverse gear, fitted into extended base, is entirely enclosed. A Detroit nine feed mechanical oil lubricates all cylinders and bearings automatically. "Schebler" carburetor and "Bosch" or "Dixie" high tension magnetos are also a part of regular equipment. A two unit "Leece Neville" starting and lighting outfit is supplied also when desired.

Anderson Marine or General Utility Gasoline Engines

These engines are light, compact and strictly high grade in every detail of design and construction.

The cut shows a four cylinder 5x6 24 H. P. engine. The cylinders are of the "T" type, cast integral and require no gaskets.

Exhaust manifold is water jacketed and water intake and overflow manifolds are of polished brass, fastened with studs to top and side of cylinders. A large brass plunger or gear pump forces the cold water directly around each exhaust valve in such a manner that all parts of cylinder are kept constantly at an even temperature.

Universal General Utility Gasoline Engine

A strictly high class, dependable four cylinder engine, equally adapted for marine or general utility work. Every detail is properly designed and constructed. All parts are interchangeable and easily accessible. Liberal provision is made to take up wear. Large wearing surfaces are provided and small wearing parts are hardened.

A distinctive feature of this engine is the extreme smoothness of operation, due to a substantial and sensitive throttling governor, which acts on the throttling valve of the carburetor.

It is equally well adapted for lighting, or driving, boats, house or town lighting, moving picture work, searchlights, wireless telegraphy, battery charging, etc.

It is made in one size only and develops from 9 to 12 H. P. at speeds ranging from 1100 to 1700 R. P. M. and will operate on kerosene when necessary.

On Stationary Base Direct Connected to Dynamo

Specifications

- Cylinders.** Four cylinder cast en bloc, 2½-inch diameter, 4-inch stroke. Inlet and exhaust manifolds cast integral.
- Pistons.** Close grain iron, fitted to cylinder with 3/1000-inch clearance and three packing rings, piston pin hollow hardened and ground.
- Crank Shaft.** Drop forged steel accurately ground, 1½-inch diameter, crank pins 1½x1½-inch.
- Connecting Rods.** Drop forged steel, heat treated, fitted with bronze piston bushing and the cast crank pin bearings.
- Cylinder Head.** Covering all cylinders, removable, exposing all valves and pistons, packed with copper asbestos gasket.
- Ignition.** High tension independent magneto or Atwater-Kent unisarker.
- Fuel Feed.** High grade float feed carburetor with throttle fitted to governor.
- Governor.** Two ball centrifugal type enclosed in oil tight case and fitted with non-fluctuating dash pot.

Prices

Engine only, on stationary base, for belt drive with Atwater-Kent ignition system, carburetor, flywheel pulley 13 inches diameter, 3-inch face, speed 1100 R. P. M.

Price	\$240.00

Prices for marine equipment quoted upon request.

On Marine Base

T. & M. Gasoline Marine and General Utility Engines

The lubrication is obtained from oil mixed with the fuel in the proportion of one pint to 5 gallons of gasoline. We also supply an oil cup on inlet pipe of 3 H. P. motors and above, so that oil cup lubrication or both can be used if desired.

Water pumps of extra large capacity supplied for cooling cylinders, and provision is made for admitting water spray into the exhaust chamber for cooling it and exhaust pipes. Propeller shaft thrust taken by ball bearings. Semi-universal shaft couplings prevent strain from improper alignment.

The Evenrude

Detachable Row Boat and Canoe Gasoline Motor

A Light, Portable and Thoroughly Dependable Motor Which Can be Attached to a Boat of Any Kind

These motors are as well and perfectly made as the finest automobile engines. They are used on row boats, canoes, scows, work boats, rafts and in fact any craft within the scope of its power.

The motor is a light, compact unit with no detached parts. It is easily and quickly attached, or removed, and transferred from one boat to another. When starting on your vacation, slip it into a small canvas bag and carry it as you would a suit case. Clamp it in a moment to any boat you use and it is ready for immediate service. Can also be used for stationary work, driving machines, etc.

The immense success and efficiency of this motor is indicated by the fact that they have been adopted by 22 different governments, including our own, and over four thousand are in daily use in the Scandinavian fishing fleet alone.

The magneto is built into and made part of the flywheel. All parts and connections are made water proof and effectually insulated against spray or moisture.

It is absolutely guaranteed to give a hot spark under all conditions of speed on either clear or salt water.

By means of a special coil the boat can be electrically lighted from the magneto.

Oil for lubrication is mixed with the gasoline in tank, provision being made to insure the correct proportion of each. The steering is through the propeller. The speed control from maximum to slowest trolling speed is simple and conveniently manipulated.

A full description of the construction and many attractive features of this motor will be furnished on request.

The standard A and B row boat type motors have nickel plated, polished flywheel, highly polished exhaust pipe, silencer, propeller and gear housing.

The Commercial models, C and D, do not have the fine finish of the A and B, nor all of the conveniences and safe guards.

Model	H. P.	Cycle	Cyl's	Description	Price
A	2	2	1	Standard, with magneto, silencer and automatic reverse, complete	\$107.00
B	2	2	1	Standard, reversible, with magneto and Evenrude silencer, complete	94.00
C	2	2	1	Commercial, with magneto, silencer and automatic reverse, complete	94.00
D	2	2	1	Commercial, reversible, with magneto and silencer, complete	80.00
A	3 1/2	2	1	Standard, with magneto, silencer and automatic reverse, complete	167.00
B	3 1/2	2	1	Standard, reversible, with magneto and silencer, complete	153.00
AA	4	4	2	Four cycle twin with magneto, silencer and automatic reverse, complete	167.00

Note.—Above prices include Evenrude silencer. The Maxim silencer will be furnished for \$3.50 extra for the 2 H. P. and \$5.50 extra for the 3 1/2 H. P.

Stover Horizontal Hopper Cooled Gasoline Engines

Stover Horizontal Hopper Cooled Gasoline Engines

Engine Bed

Engine Bed. Constructed with heavy housings between the cylinder and the bearings. Pillar blocks are cast at an angle of 30 degrees, distributing the thrust equally throughout the bed itself.

Connecting Rod. The piston end of this is furnished with a removable split brass bearing which can be adjusted without removing piston. Upper half of crank end bearing is also removable, which provides easy replacement of both bearings when necessary.

Hopper Cooled Engines. Engines with this type of cool-

ing system are built in sizes from 1 to 14 H. P., inclusive. The Hopper, which is cast on the cylinder is large enough to hold the proper amount of water to keep engine at an equable temperature.

Fuel Pump is attached to main frame of engine and both pump and plunger are made of brass. A stuffing nut and gland make this pump easy to repack when necessary.

Crank Shafts: Smaller sizes are drop forged; the larger sizes are forged from solid open hearth steel billets. They are

Drop Forged Crank used on Engines up to and including 8 H.P.

carefully centered and turned to size and are also interchangeable.

Bearings. Main shaft bearings are extra long and fitted with best quality, high speed babbit metal. Main bearings of the horizontal engines are placed at an angle of 30 degrees. The bushings are at the same angle, hence the piston thrust is delivered at the strongest part of bearings, distributing strain equally throughout main frame.

Connecting Rod used on Engines up to and including 8 H. P.

Testing. Each engine undergoes a most careful and thorough test before leaving factory and must show a strong surplus of power over the catalog rating.

Improved Ideal Gasoline Engines

Type "M"

These Engines are designed for Concrete Mixers, Sprayers and Contractors' Machinery. They are of upright construction and fitted with the latest improvements.

Cooling Tank is of ample dimensions for supplying water around valves, which are large enough to insure cylinders receiving sufficient gas at all times. The large exhaust valve allows air to be drawn back and forth helping to cool cylinder. The carburetor, as shown in illustration, is placed on the side of cylinder so that the air is warm and dry, permitting the use of low grade gasoline. By means of the specially constructed governor the speed of engine may be regulated without stopping. Lubricating oil is always kept at a uniform temperature in pocket underneath water jacket. Ignition is of the jump spark type. Cylinder, Rings and Piston are of highest grade material and workmanship, accurately finished and are interchangeable. Crank shaft and connecting rod are solid drop forged.

Every machine is carefully tested before leaving factory.

We have a pump for every purpose. See index of this catalog.

The Venn-Severin Vertical Oil Engine

This engine is designed and constructed along distinctive lines which avoid the difficulties common to most gas and oil engines.

It operates at ordinary gas engine pressures, not too high to cause wear or breakage, nor too low to interfere with efficiency. Every part is reduced to the most simple mechanical form. All gears, valves, magnetos, batteries, carburetors, etc., are eliminated. There are no adjustments necessary, to meet changes in load, fuel, climate, etc.

The Venn-Severin is distinguished from other crude oil engines in its principle of internal carburetion. The fuel is not injected against a red hot surface, but is sprayed by a patented inspirator in perfectly vaporized form into every part of the compressed air in such a manner that a gaseous mixture, or carburetion, is formed, which ignites spontaneously from the heat of the compressed air.

Inspiration of the oil occurs near dead center, the moment combustion is desired, thereby eliminating pre-ignition which is so destructive to an engine. Ignition is instantaneous and combustion complete.

For these reasons it runs with exceptional smoothness and a total absence of any perceptible jar or knock. Therefore, there is no danger of breaking any parts or causing early deterioration of the engine.

The superior principle of operation is indicated by the exceptional low fuel consumption which averages from .65 to .75 of a pound of fuel oil per H. P. hour. It will operate with equal success on any kerosene fuel and crude oil provided these oils are in a free flowing water like condition.

This engine has given exceptionally good results in every class of service. It is particularly adapted for electric light and power generation for pumping plants, factory power houses or other service requiring continuous heavy duty. It is built in both stationary and marine types.

Marine engines from 10 to 120 H. P. Prices on application.

The Bessemer Horizontal Oil Engines

Of massive construction well balanced and very symmetrical in design.

Its functions being comparatively few and easily understood a skilled mechanic is not required to operate.

The cheapest grade of crude oil may be used, which together with its simplicity of parts and low cost of maintenance make it a very economical proposition.

The crank end of the cylinder is used as a pump, to furnish the air necessary for combustion of oil.

Into this crank end of the cylinder, during the head end stroke of the piston, air is drawn through the valve at the bottom, filling the evacuated space at atmospheric pressure.

During the crank end stroke of the piston this air is compressed slightly (to about 5 pounds per square inch) and immediately upon the uncovering of the inlet port in the upper side of the cylinder by the piston this compressed air rushes over to the head end of the cylinder, sweeping before it and out of the exhaust ports at the bottom of the cylinder, the burned products of the previous charge.

Upon the following head end stroke the fresh charge is compressed in the combustion end of the cylinder, while a new charge is being drawn in at the crank end. A pump injects fuel into the combustion chamber, near the dead center, which is ignited by contact with the hot surface of the ignition bonnet in the head, and drives the piston outward upon its power stroke. The ignition bonnet is heated by means of a gas or kerosene torch for a few minutes before starting, after which the combustion supplies the necessary heat for ignition.

Bessemer oil engines are built in single cylinder type to 85 H. P. and in twin cylinder type to 180 H. P. They are guaranteed to develop their full rated horse power at the shaft, and there is an overload capacity sufficient to handle and overcome the heavy starting torque of high speed machinery or motors, or for an occasional peak load, such as sometimes occurs in wood working plants. They will overcome certain losses due to high elevations, but in choosing any engine, it is advisable to allow for the standard corrections for elevations. Bessemers are tested at 1250 feet.

Special bulletin with full description sent on request.

Prices also on request.

Vertical Steam Engines

Side and Center Crank

Class "B" Side Crank Engines

We present this style of engine as the most desirable for general purposes where a vertical engine can be used—they are well proportioned, strong and heavy in construction and will stand hard work and high speed.

Equipped with Gardner throttling governors. Above 20 H. P. these engines have center oiler for the crank pin.

Class "F" Center Crank Engines

Owing to simplicity in construction this type can be produced at lower cost than the Class B.

Every engine is thoroughly tested and placed in running order before leaving the shops.

Price does not include stock or Exhaust Piping.

Class "B" Self-Contained Disc-Crank Horizontal Throttling Engines

Suitable for all kinds of work where high speed and smooth running are required. The engine being all complete on a single cast-iron base, prevents any of its working parts from becoming deranged or out of line. The material is of the best that can be obtained, and the workmanship is excellent.

Horse Power	Size of Cylinder, Inches	Speed Rev. per Minute	Size of Steam Pipe, Inches	Diameter of Shaft, Inches	Fly-wheel		Floor Space, Inches	Approx. Weight, Pounds	Price with Trimmings

35	11x13	160	2 1/2	3	48	11	50x72	4700	555.00

Fixtures: Include Gardner governor with belt, sight feed lubricator, three oil cups, throttle valve with nipples, drain cocks and wrenches; no foundation bolts.

Side Crank Throttling Engine

The frame of this engine is of the side crank rolling mill type with the fly wheel between bearings. The main bearings in all engines with 6-inch shaft and under are of the angle type adjustable to wear by means of liners. On engines with 7-inch shaft or over the main bearings are of the quarter box type adjustable to wear by wedges which can be adjusted while the engine is running.

These are strictly high class engines in design, material and workmanship. Complete specifications will be furnished on request.

We furnish with each engine, throttling governor with automatic stop and belt, angle throttling valve with nipple, sight feed cylinder, lubricator, centrifugal oiler for crank pin, cylinder drain valves, three drop forged wrenches, blue print setting plan and book of instructions for setting and operating.

Steam and exhaust pipe and fittings, foundation bolts, plates and templates, piston and valve rod packings are extra.

Before leaving factory all engines are thoroughly tested under actual working conditions, and indicated to properly set the valves and adjustable parts.

4, 5 and 6-inch shaft engines have angle bearing.

7, 8 and 9-inch shaft engines have quarter box bearing.

Quarter box bearings can be furnished on 4, 5 and 6-inch shaft engines, if desired, at an additional cost.

Note.—All engines good for 150 pounds working pressure.

Heavy Duty Side Crank Automatic Engine

Ohio Frame Type

As indicated by the illustration and table below, this engine is of the medium speed, heavy duty class with single automatic cut off valve.

The frame is well proportioned, pleasing in appearance, strong and rigid under severe strains. The cross head guides and main bearing are cast as part of the frame. The guides are circular and are bored at the same time that the frame is turned to receive the cylinder, thus assuring perfect alignment between piston and cross head.

The governor is of the well known Rites Inertia type and is of latest improved design and is the most efficient and sensitive regulating device ever applied to a steam engine.

There is also furnished a sheet steel oil shield of neat appearance which protects the floor and allows the oil to be caught, filtered and used again. The entire system of lubrication is very simple and efficient.

Every engine before leaving the shop is tested under steam, with brake, indicator and hometer, so that all parts are properly adjusted, valves properly set and speed determined under extreme conditions. These tests are more severe than is likely to occur in practice. The engine is placed in first class running order before it leaves the testing room.

3, 4, 5 and 6-inch shaft engines have angle bearing.

7, 8 and 9-inch shaft engines have quarter box bearing.

Quarter box bearings can be furnished on 4, 5 and 6-inch shaft engines, if desired, at an additional cost.

Note.—All engines good for 150 pounds working pressure.

Standard Fittings

With each heavy duty automatic engine we furnish elbow throttle valve, sight feed oil cups, sight feed cylinder lubricator, centrifugal oiler for crank pin, safety cylinder drain valves and pipe, oil shield for crank disc, three drop forged wrenches, blue print setting plan.

Extras.—Steam and exhaust pipe and fittings, foundation bolts, plates and templates, piston and valve rod packing.

Full Length Tube Vertical Tubular Boilers

Fig. 2219
Regular or Octagon
Base

These boilers are made of open hearth flange steel plate, having a tensile strength of 60,000 pounds per square inch of section.

All sizes above 20 inches are well braced by means of stay bolts, and all boilers 30 inches and upward in diameter have their vertical seams double riveted. From No. 1 to No. 10, inclusive, the shells are made of a single sheet.

Boilers 20 to 30 inches in diameter have two, and the larger sizes three hand holes around the water leg, and the same number above the crown sheet. In boilers 20 inches in diameter the water space around the firebox is $1\frac{1}{2}$ inches wide, in the 24-inch diameter 2 inches, and in all other sizes $2\frac{1}{2}$ inches wide.

The fixtures comprise base, grate, hood, steam gauge, glass water gauge, gauge cocks, either pop or lever safety valve, blow-off valve, check and stop valve.

Carried in Chicago stock up to 35 H. P.

Portable Locomotive Fire-Box Boilers

Water Front—Open Bottom

The most popular style of boiler for contractors' work which requires moving from job to job.

These boilers are regularly constructed for 100 pounds working pressure, with water front and open bottom. When required, we can make them with water bottom, also for 125 pounds working pressure. All boilers are subjected to a hydrostatic test pressure 50% greater than the working pressure for which they are built. Open-bottom boilers are made with wrought-iron mud-rings. The fire-door opening is formed by danging the furnace sheet outward.

A regular "complete outfit" consists of boiler, mounted on skids, with fixed dome, cast-iron smoke-box head with flue doors, common grates with rests, fire-door, stack of No. 16 steel with galvanized guy-wire six times length of stack, lever safety-valve, water-gauge, three gauge-cocks, steam gauge with syphon and cock, feed-valve, check-valve, and blow-off cock. Tools are extra. Sheffield or Tupper grates can be substituted for common grates without change in price. With open-bottom boilers, Century rocking grates can be furnished at an extra price.

Standard Horizontal Tubular Boilers

Built for 100—125—150 lbs. Working Pressure
With 3, 3½ or 4-inch Tubes

Full Front Setting

Complete Outfit consists of boiler with front, common grates and rests, back arch bars, soot door and frame, stack with guy-wire six times length of stack, and trimmings consisting of water column, water gauge, three gauge cocks, steam gauge, lever safety valve, check and stop valves, [and blow-off cock. Buck bars and rods, fire door arches, wall plates and [rollers are [only furnished when specified and at an extra price. Sheffield or Tupper grate bars are furnished instead of common grates without change in price. Fire tools, consisting of hoe, poker and slice bar, are extra. With boilers 18 feet and over in length we furnish three sets of buck bars and rods for side walls; with all other lengths, two sets. When specified, we will furnish boilers without dome, or with dry pipe or baffle plate.

With the bare boiler is furnished legs and skids for support; No. 10 steel smoke box as shown by cut; shell extended at rear for combustion chamber, intended for fire brick lining (no brick furnished), with ¼-inch steel door on end with cleaning-out door near bottom; cast iron front and doors for end of furnace as shown by cut, with liner for fire door and dead plate for front support for grates; sheet iron ash door under front.

Man hole in shell and two hand holes in front head.

Furnace of first three sizes in one plate, others in two plates and are made with lap seams single riveted.

Longitudinal seams of shell, vertical and flange seams of dome double riveted; heads and girth seams single riveted; domes 22-inch diameter are single riveted to shell. Heads braced with through rods.

Fixtures Comprise: Grates the width of furnace with bearers; safety valve (ball and lever or pop); steam gauge with syphon and cock, water gauge and three gauge cocks attached direct to shell; blow-off valve, check valve and feed valve; smoke stack of No. 16 steel with galvanized guy wires (four times the length of stack).

Style B—Kelly Rocking and Dumping Grates

With double width rear dump grate operated independently of front grates

Shows grate surface two sections wide—one section dumped. Note position of the double capacity rear dumping grates.

Shows all grates in dumped position. Side bearing bar shown in outline only to give a clear view of the operating levers.

By referring to the illustrations, it can be seen how convenient and easy it is to clean these grates—especially, the rear portion which ordinarily receives the least attention because it is out of reach of the fireman—but with this wide rear dump feature, it is really the easiest portion to clean and can be done without extra exertion and exposure to heat and dirt.

The combination of the rocking and dumping feature entitles this grate to recognition as a modern and economical device for coal burning furnaces—and, while it is a hand fired device, it embodies three prominent features of a mechanically fed furnace:

First—The agitation and breaking up of the fuel bed by the rocking movement.

Second—The tendency of the rocking motion to shift the fuel toward the rear.

Third—The large dumping grate at the rear of the furnace which enables the operator to dump the accumulation of clinker and ash.

This grate is made to fit any size furnace and with air space best adapted to the kind of fuel used, it is self-contained and does not require any alteration in the ordinary furnace to install.

No fingers to burn off—expands and contracts evenly with less liability to warping.

All parts are in duplicate—no trouble in securing repairs when you need them (see below).

The Class B grate with the double width independent rear dumping feature is especially valuable where grate is over 60 inches deep, or where the coal is inclined to clinker. The Class A grate is sold at the same price and is the same as Class B with the exception of the wide independent rear dump feature.

Price Styles A or B Grates..... \$6.00 per square foot

Style A same as Style B, but is without the double width independent rear dumping grate.

Directions for Ordering—State length of actual grate surface; give width of the dead plate exclusive of the bearing lip; advise kind of fuel used or state air-space desired; give size and location of fire and ash doors; give distance between door jams in center of front; give distance from base of hinge lug to outside edge of grate surface.

Simplex Shaking and Dumping Grates

These grates are made with the proper air space, and made to go into any fire box without making changes. They can be put in by any mechanic. If you are using lump coal, you can use slack at a much less cost. If you are using slack, you can use a great deal less slack and get the same results.

Simplex Grate will pay for itself long before it is worn out, in reducing the time required for cleaning, for while this work is in progress but little steam is

formed, hence the pressure must fall, and it requires a very brisk fire to raise it again, which means rapid consumption of fuel. Any improvement which shortens the time referred to reduces the fall in pressure, hence saves coal.

Price, complete..... \$5.50 per sq. ft.

In ordering Grates be sure to state exact size of furnace and depth of ash-pit.

Wilkes' Water Heaters

Especially adapted for heating water for dwellings, barber shops, bathstudies, carving tables, laundries, conservatories, poultry houses, etc. Easily managed and economical in fuel. Fire is entirely surrounded by water, and so gives it the greatest heating surface and capacity, as motion of water is entirely vertical, affords an active and continuous circulation, commencing as soon as water begins to warm.

The coal magazine is a great labor and fuel saver, as an even and continuous fire from 10 to 12 hours and longer may be maintained without attention. Hard coal, range or chestnut size is best suited for use in magazine. Soft coal may be used by leaving off bottom part of magazine and making it a surface burner.

Self feeding heaters are equipped with a round base, sectional, shaking and dumping grate, which can be removed or replaced without disconnecting heater. Smaller sizes, not self-feeding, are equipped with a shaking and dumping grate with center draw slide, which can be removed through base door.

All heaters are carefully tested to 100 pounds hydrostatic pressure.

Small Size Heater. Not Self-Feeding

Round Base, Sectional and Dumping Grate. Furnished with all Self-Feeding Heaters except 36 and 42-inch diameter.

Self-Feeder

Chicago Water Heater and Garbage Burner

Fig. G.... Nos. 5 to 10

Fig. G.... Nos. 1 to 4

Made of steel boiler plate carefully riveted and braced. Tested to 100 lbs. hydrostatic pressure.

Garbage grate of boiler tubing fastened by being expanded into openings in the inner shell. This grate thus forms part of the heating surface and there is constant circulation of water through the grate tubes, increasing efficiency and preventing injury to tubes.

Removable clean-out plugs in outer shell opposite the ends of each tube for cleaning out sediment and scale. Clean-outs for water jacket also provided in each corner end.

Base has sectional rocking boiler grates so that soft coal can be used successfully.

Staggered arrangement of tubes provides additional heating surface and burning surface for garbage.

"New Water Tube" Feed Water Heater and Purifier

New Water Tube

Contains a nest of "U" shaped seamless drawn brass tubes—in the smaller sizes incased in a cast iron shell—in the larger sizes shell is of steel.

The exhaust steam enters the shell near the bottom and is discharged from the outlet on the top of the heater. The feed water enters on the side near the bottom and is circulated through the nest of tubes, taking up the heat from the exhaust steam. After it has passed through the entire heating surface, it enters the settling chamber at the bottom, from which impurities may be blown off. The hot water is then discharged to the boilers from the outlet, on the side, near the bottom as shown.

Construction gives positive and rapid water circulation and produces a very high temperature of the feed water.

An Important Feature: The shell, tube sheet and tubes may be removed for cleaning or repairs without disturbing the water, mud blow or drip connections or the supports upon which the heater rests.

Larger sizes quoted upon request.

The "Standard" Feed Water Heater

A simple straight tube closed heater. The inner heads are connected by tubes through which the exhaust steam passes from the lower steam chamber into the upper one, thence to the air without any back pressure on the engine. Handholes are conveniently placed to afford ready access for cleaning. Body of heater is kept constantly full of water surrounding the tubes through which the steam passes.

The "Springfield" Open Heater and Lime Extractor

Water is admitted through the feed pipe in the top, passes over a series of pans surrounded by steam, heating the water to around 212 degrees, condensing nearly all the steam and precipitating the impurities. The water then filters through the lower chamber, which is filled with fine excelsior, from which chamber it is discharged to the pump. Prices include automatic feed water regular and oil extractor.

The "Stillwell" Open Feed Water Heater

A combined heater, purifier, filter and lime extractor, with nine large shelves or corrugated pans which rapidly and thoroughly separate and deposit the lime or other earthy salts.

The filter is of the upward type, of large capacity, located under the bottom shelf, convenient for renewing filtering material.

Price includes automatic cold water regulating device, steam and water flanges, water gauge and bibb cock.

"Progress" Steam and Hot Water Boilers

The Base

and thorough. Mention should be made, in the interest of fuel economy, of the advantage in temporarily shutting off part of the grate not required in mild weather, by shaking and cleaning only such bars as may be needed. Around the outer edge of the grate is a deeply corrugated base lining which admits a free passage of air to the side of the fire, thus insuring perfect combustion.

Perfect Circulation

By examining the illustration at the right it will be seen that the "Progress" sections are triangular in form. The water passing up the sloping side directly over the fire follows the line of the most intense heat, with no resistance, then flows easily over the crown sheet toward the rear and then down the back port to the bottom of the section, where, again coming in contact with the extreme heat it rises, as before, rapidly discharging its accumulated steam, thus confirming our claim of perfect circulation.

Fire Travel

The fire entirely surrounds the V shaped water-ways, which absorb the greatest amount of the intense heat; then traveling through the lower flues to one end of the boiler the hot gases rise to the super-heating chamber, then pass to the other end of the boiler where, with a downward dive into the return flue, they again traverse the entire length of the boiler, before the final exit into the smoke flue.

Important

The following ratings provide that in estimating the size of boiler required, all piping (mains and risers, flow and return) shall be figured as radiating surface in addition to the direct radiation to be used. The ratings for steam are based on a standard of two pounds pressure at heater; and of water, a temperature of 180 degrees at it leaves the boiler. For indirect work add 75 per cent. greater boiler capacity. For direct indirect add 40 per cent. boiler capacity.

If mains are bare, the number of square feet of radiation they contain should be 50 per cent. additional in computing size of boiler required. For example: If there are 100 square feet of surface in the mains uncovered, the boiler capacity required for the mains will be the same as for 150 square feet of direct cast iron radiation.

The ratings are also based upon the further proviso that sufficient radiation is installed to properly heat the building, that the apparatus is properly installed, that the boiler is attached to a flue of sufficient capacity and draft, and that the boiler after having been placed shall receive proper fuel, care and management.

Our boilers are guaranteed only to the extent of furnishing new castings for any found defective in manufacture.

The foregoing ratings are conservatively made in accordance with accepted standards, but on account of the varying conditions surrounding the installation of boilers we do not guarantee our heaters except as above.

When a pipe coil or cast-iron section is introduced into the fire pot of a boiler, or a steam coil placed in a tank for the purpose of heating water for domestic use, additional capacity must be provided in determining the size of boiler required, namely: 2 square feet of direct radiation for hot water, or 1 1/4 square feet of direct radiation for steam, for each gallon to be thus heated per hour.

The "Progress" Boiler is a distinctly individual type, possessing more points of merit than any other boiler on the market today.

The feed doors, being placed in the side, instead of the front of the boiler, (see illustration on next page), makes it a very easy one to fire and clean, owing to the short depth of the fire chamber.

The wonderful success of the "Progress" is due to thorough combustion of fuel, and the perfect circulation of the water in each section, caused by the unique triangular construction of the sections, coupled with the triple fire travel—advantages which are found only in the "Progress."

The Base

The Base, being 16 inches high, affords ample draught and unusually large space so that ashes may be easily removed. The grate rocking attachment is located on the outside, at the rear, doing away with any possibility of burning or warping these parts.

The Grate

The grate bars are constructed so that by connecting them together in pairs or triplets the shaking and cleaning is easy

Progress Perfect Circulation

"Progress" Steam Boiler
22-Inch Series

628-W	2600	555.00
728-W	3350	687.00
* 828-W	4100	800.00
* 928-W	4850	905.00
*1028-W	5650	1011.00

Do not bush flow pipe opening. Connect full size of outlet.

"Highgrade" Round Steam and Hot Water Boiler

Steam Boiler

Base

Wheel Section

Showing Grates Being Removed

Water Boiler

The Thatcher Round Boiler is easy to install and operate, economical in the use of fuel, and its unique construction, embodying many new features, will appeal to owners, architects and contractors who are interested in the installation of first-class heating apparatus.

The Base is high, with ample space under the grates making an ashpit that is easily cleaned.

Wheel Sections are formed with a waterway on the outside of the flues, as fire does not come to the outside surface, except at the cleanout doors. Ports in wheel sections are staggered, and consequently, cleanout doors do not become overheated.

Fuel. Grate is so constructed that hard or soft coal may be burned. Especially adapted for pea coal or may be fitted with burners for natural gas.

Perfect Combustion. By having grate below bottom of firepot, the air comes in at sides as well as from bottom, thereby producing perfect combustion, and all the fuel is consumed, instead of leaving a black ring of unburned coal around edge of firepot, as is the case with other round boilers.

Perfect Circulation. Inside of firepot is corrugated with a deflecting surface at top. As fire rises, it coils around this deflector, and the heat impinges the upper surfaces. The water rises in the thin or narrow waterways of firepot to top, where it flows to the large columns, returning to bottom, thus producing perfect circulation.

"Leader" Sectional Steam and Hot Water Boiler

The "Leader" Sectional Boiler is intended to be used in place of the large size round boilers. The grate area is much larger, and is much easier to fire and clean. The fire travels twice as long and this, coupled with the evenly proportioned flues and deep overhanging fire surfaces, make the "Leader" Boiler a surprisingly powerful heater. Feed door is unusually wide and high enough above grates to allow a large body of coal to be carried, a great factor in fuel economy and convenience in firing. Grates are heavy oval top pattern, suited to pea or soft coal burning when desired. The Leader is a thoroughly reliable heater, and the sections are easily and quickly erected.

Steam Boiler

Height of boiler to flow openings	49 in.
Width of boiler	29 in.
Size of smoke pipe	9 in.

Geyser Tank Heater

The Geyser Tank Heater is a wonderfully efficient heater. The Flow and Return connections are at the rear on either side of a division plate cast in the body, thus circulating the water completely around the firepot. The inner corrugated surface makes this firepot extremely sensitive to heat and a very quick circulator. The top with two large covers forms an opening large enough for a wash boiler-making it particularly useful in the laundry.

Specifications

Height of Flow from Floor	18 1/4 in.

Galvanized Expansion Tanks

Expansion Tanks are placed at the highest point of the heating system to provide for the expansion of the air and water when boiler is first fired.

These tanks are made of refined boiler steel, double riveted, caulked and galvanized and tested to one hundred and fifty pounds pressure.

They are tapped top and bottom for one inch overflow and expansion pipe, and on the side near the top, 1 inch for filling attachment.

They are also tapped on side for 1/4-inch water gauge brasses and 12-inch glass.

Minneapolis Heat Regulator

What it Does

The Minneapolis Heat Regulator is a device consisting of

(a) The Thermostat or mechanical thermometer, designed for attaching to the wall of the living room.

(b) The motor which supplies the means of operating and is fixed in the basement.

This Regulator will keep the house at an even temperature, thus preventing the discomforts of having the rooms either too hot or too cold and at the same time saving unnecessary consumption of fuel.

It will prevent destruction of property by fire and prolong the life of a heater by always closing the draft before the fire gains too much headway.

It will relieve the mind entirely of the care of the draft dampers and the fear that at night, or during absence for a few hours, there is danger to life and property through neglect of the heater.

It controls equally well on Hot Water, Steam, Gas, Hot Air and Combination Heaters and will quickly demonstrate that no heating plant can be efficient or complete without it.

The clock time attachment allows a lower temperature at night and at any set hour of the morning will automatically turn the indicator to seventy degrees, or any other predetermined temperature, thereby giving the occupants of the house a warm and comfortable home on arising.

Model No. 35

Thermostat is attached to the wall with concealed wiring running to basement. It is handsomely finished and fitted with a reliable thermometer. Time attachment may be fixed so as to give any desired temperature at a given hour and is fitted with one-day clock.

The motor is of the gravity type and has ample power. Designed for fastening to the ceiling of basement and is very compact. Enclosed in pressed steel case. Brass gears with steel pinions, running in bushed brass bearings. Frames of pressed steel.

The power is furnished by an iron weight of ample size to lift all dampers on the modern type of furnaces and is equipped with patent automatic switch which leaves drafts closed when the motor runs down, thus entirely eliminating all danger of forgetting to wind motor such as hot pipes, chance of fire, etc.

Governor regulates speed of motor and allows drafts to open and close steadily, avoiding all banging and clatter.

Shipping weight approximately 30 pounds.

Price with one-day time attachment.....\$35.00

Thermostat

Motor

Model No. 47

Fitted with a reliable clock which is hinged in front and swings in a complete circle for winding. It is easily removed while all arbors may be wound with one key.

No. 47 Heat Regulator is fitted with standard spring motor as shown herewith which is easily wound by means of crank key, and which, when run down leaves the drafts closed.

Approximate shipping weight, 30 pounds. Price complete with motor.....\$47.00

Standard Spring Motor as fitted to Models 47 and 60

Cotton sleeving used at shaft B makes cover dust and moisture proof. Basement switch C enables motor to be operated at will in the basement.

Thermostat

Model No. 60

The timepiece in this model is very high grade and both clock and alarm of same will run eight days at one winding. Clock has solid brass base, repeater alarm, jewel balance and bevel glass front. It swings in a complete circle and does not have to be removed for winding.

No. 65. Fitted with standard spring motor. Shipping weight approximately 30 pounds. Price.....\$60.00

Thermostat

Book of directions and plans for installing are furnished with each Regulator.

Window Radiators

Plain or Ornamental

Wall Radiator

Wall radiator sections are made for two methods of interconnection, as follows: The vertical section in either size is tapped on the long sides at B, C, G and F; the horizontal section in either size is tapped on the short sides at A, H, D and E. A, B, C and H are right-hand tapings; D, E, F and G are left-hand tapings.

When more than four tapings are required in one section an extra charge is made.

When Ordering Wall Radiators

Give number of 5, 7 or 9 foot sections in each radiator.

How assembled, horizontal or vertical.

Give location of supply and return tapings.

Specify size of tapings.

State whether for water or for one or two pipe steam.

Number and kind of brackets.

Send sketch showing how it is desired they be assembled.

Data For Figuring Direct Radiation

(Based on Cubical Contents)

While the radiating surface that will be required in any room will depend very much upon the exposed wall and glass surface, there must be some relation to the cubical contents of same, and, therefore, as the simplest rule of apportioning radiation, we offer the following, derived from the experience of the best heating engineers.

The proposition being a detached building of good construction and average exposure, with outside temperature at zero. One square foot of direct radiation will heat

Hot Water Cu. Ft. space	Dwellings	Steam Cu. Ft. space
25 to 30	Living Rooms, one side exposed	45 to 50
20 to 30	Living Rooms, two sides exposed	40 to 50
20 to 25	Living Rooms, three sides exposed	40 to 45
30 to 40	Sleeping Rooms	50 to 70
20 to 30	Halls and Bath Rooms	40 to 50
30 to 50	Offices, according to exposure	50 to 75
35 to 50	School Rooms	60 to 80
40 to 60	Factories and Stores	70 to 100
60 to 100	Assembly Halls and Churches	100 to 150

(Continued on next page)

Above radiators are tapped 2 inches and bushed.

Steam—One Pipe

Up to and including 25 feet	1 in.
From 25 to 60 feet	1 1/4 in.
From 60 to 100 feet	1 1/2 in.

Hot Water—Two Pipe

Up to and including 40 feet	1 in.
From 40 to 75 feet	1 1/4 in.
Above 75 feet	1 1/2 in.

Steam—Two Pipe

Up to and including 50 feet	1 x 3/4 in.
From 50 to 95 feet	1 1/4 x 1 in.
Above 95 feet	1 1/2 x 1 1/4 in.

Distance from floor to center of opening is 3 inches.

In estimating length of radiator allow 1/2 inch for each bushing.

Steam Radiator Valves

Fig. D1

Our steam radiator valves are fitted with high grade composition discs and are made of the highest quality of steam metal. They are heavy pattern, well proportioned; the openings are full side and not obstructed. All parts are accurately fitted and the unions make up absolutely tight. Each valve is carefully tested before shipment.

Data for Figuring Direct Radiation

(Continued from preceding page)

Hot Water.—For direct-indirect radiation add 33 1/3 per cent, and for indirect radiation add 75 per cent to the amount of direct surface required to heat premises, to secure equal value of heating surface.

Steam.—For direct-indirect radiation add 25 per cent, and for indirect radiation add 50 per cent to the amount of direct surface required to heat premises, to secure equal value of heating surface.

Note.—Add to sum thus obtained a corresponding percentage to determine additional tax on heater. This sum becomes the capacity of heater for direct radiation required for the work.

Note.—Above information is not guaranteed, but is based on standard authorities.

Data for Figuring Direct Radiation

(Based on Wall and Glass Exposure)

Mills' Rule.—One square foot of radiating surface for each two square feet of glass, and for each twenty square feet of outside wall, and every two hundred cubic feet of space.

Example: Room as above.

Glass exposure, square feet	60, 1 to 2=30
Wall, outside square feet	210, 1 to 20=10 1/2
Cubic contents, cubic feet	2016, 1 to 200=10

Total steam.....50 1/2 sq. ft.

For water, by generally accepted standards, add 60 per cent, equals 80 sq. ft. water.

Carpenter's Rule.—To the square feet of glass surface, add one-quarter of the exposed wall surface; and 1/55 to 3/55 of cubical contents (1/55 for rooms on upper floors, 2/55 for rooms on first floor, and 3/55 for large halls); then for steam multiply by .25; for water by .40.

Example: Room as above.

Glass exposure, 60 square feet, to which add one-quarter of wall 210 ÷ 4 = 52, to which add (room first floor) 2/55 cubical contents — 2/5 × 2016 = 73 +. Thus 60 + 52 + 73 = 185 × .25 (for steam = 46 +; or 185 × .40 for water) = 74 square feet.

Note.—It will be observed that the ratio of the immediately foregoing practically reinforce those given in tables based on cubical contents.

Note.—Above information is not guaranteed, but is based on standard authorities.

Gripwell Automobile Tires**Guaranteed 3500 Miles**

The inherent exceptional qualities and built-in sturdiness of Gripwell tires have advertised themselves throughout the country.

The multitude of satisfied users are only too pleased to recommend a standard tire of exceptional merit at a reasonable price.

**Non-Skid Casing****Plain Tread Casing**

Gripwell Automobile Tires

Guaranteed

3500

Miles

Most Miles

Per

Dollar

In offering our own brand of automobile tires, the "Gripwell," we are confident they are the best tire value the market affords. They are strictly first quality and are guaranteed against defect in material and workmanship.

Only the very best materials are employed in their construction; genuine Sea Island cotton fabric, the best and strongest tire fabric known. This fabric is impregnated with pure rubber, which surrounds and encases every thread, and prevents fabric disintegration.

Gripwell tires are now manufactured from a new special formula of real resilient rubber which makes them the easiest riding tire on the market. It is of just the correct texture to resist undue wear, and just soft and "bouncy" enough to greatly minimize the dangers of stone bruising.

Our exclusive design, the Gripwell Non-Skid Triangle, we think is absolutely the best non-skid design in use. It is not only a positive non-skid on wet pavements and slippery roads, but possesses remarkable tractive power on muddy and sandy stretches, where the ordinary fancy tread is ineffective.

Notice the width of the center and two outside strips of rubber, how they are tied together, and the source of the actual non-skidding feature, the "Triangles." Notice their deep pockets for digging into the sand and mud, preventing the dangerous side slipping and last but not least notice that for smooth roads and boulevards the center and side corrugations with the triangles, form a continuous rolling and perfectly smooth contact with the roadway.

This, in conjunction with the new tread of real resilient rubber, imbues the rider with a luxurious floating sensation as if riding on air. This is when easy riding tires are appreciated, and one reason why we have so many contented users throughout the country.

In the matter of adjustments, if you have a grievance against any Gripwell tire, which you think has not given entire satisfaction, we sincerely request that you return it to us, so we can make it satisfactory.

All adjustments are made on a basis of 3500 miles service. Most Gripwells will, however, give service far in excess of this amount. The percentages of returns is negligible, the smallest we have ever had.

The weights given below are approximate only to be used in estimating transportation charges. The weight of a tire has nothing to do with its quality or wearing qualities.

Size, Inches	Triangle Non-Skid Tread	Gripwell Smooth Tread	Apprx. Wt., Lbs.	Size, Inches	Triangle Non-Skid Tread	Gripwell Smooth Tread	Apprx. Wt., Lbs.	Size, Inches	Triangle Non-Skid Tread	Gripwell Smooth Tread	Apprx. Wt., Lbs.

Gripwell Inner Tubes

Every Tube is Packed in a Waterproof Bag

No better inner tubes than Gripwell are made, regardless of price. They are made of pure Up River para rubber by the laminated process of building up, layer upon layer, and curing all into one solid unit. An imperfection in one layer is corrected by the others and does not affect the efficiency of the tube, as an imperfection would only affect the thickness of a single layer.

The possibilities of a slow leak are minimized.

They are dense in texture, minimizing punctures and blowouts and do not become spongy or brittle from repeated vulcanizing.

Garnet tubes have an extra heavy wall and are especially cured to produce toughness and resiliency and to resist heat and hard service.

The gray tubes are also highly satisfactory and the equal of other tubes, except the Garnet.

Prices of Gripwell Inner Tubes

Useful Information Regarding Gripwell Tires

Gripwell Tire Types

Fig. 1

To insure our customers ordering the form of tires adapted to their rims, we illustrate herewith the types we furnish.

Fig. 1. Regular Clincher. This type of tire is designed for use on the standard one-piece clincher rim. It is constructed with a soft bead, to permit stretching of tire over rim when removing or applying.

Fig. 2

Fig. 2. Quick detachable Clincher. This type is very similar to the regular clincher, except that it has a hard bead, enabling the detachable rim to hold the tire with a firm grip and prevent it from being forced over the rim by air pressure. This type is intended for use with standard quick detachable rims.

Fig. 3

Fig. 3. Straight Side Q. D. This tire is built with a straight wall bead, a wire cable extending through the base of its side walls and providing the necessary tension to retain the tire between the side beads of the quick detachable rim.

Many of the medium and higher priced automobiles are now equipped with detachable side and lock rings, enabling the motorist to change his rim equipment from Q. D. clincher to straight side Q. D. (Dunlop) or vice versa.

When ordering tires be sure to state exactly which type of tire is desired and thus do away with unnecessary delay, correspondence and expense.

Over Size Tires

The following sizes of casings may be substituted for regular sizes as indicated without changing rim. For example, a 28x3-inch tire (used on a 28x3-inch rim) is interchangeable with a 29x3 1/2-inch tire. The larger sizes are built heavier throughout and contain 30 to 50 per cent greater cushion of air, thus reducing tire upkeep and adding to easy riding.

A 29x3 1/2-inch tire will fit a 28x3 -inch rim.

A 31x3 1/2-inch tire will fit a 30x3 -inch rim.

A 31x4 -inch tire will fit a 30x3 1/2-inch rim.

A 33x4 -inch tire will fit a 32x3 1/2-inch rim.

A 35x4 -inch tire will fit a 34x3 1/2-inch rim.

A 35x4 1/2-inch tire will fit a 34x4 -inch rim.

A 37x4 1/2-inch tire will fit a 36x4 -inch rim.

A 37x5 -inch tire will fit a 36x4 1/2-inch rim.

Weights Which Tires Should Carry

Without Passengers or Luggage

3-inch tires, all diameters	350 pounds per wheel
28x3 1/2-inch tires	400 pounds per wheel
30x3 1/2-inch tires	450 pounds per wheel
32x3 1/2-inch tires	550 pounds per wheel
34x3 1/2-inch tires	600 pounds per wheel
36x3 1/2-inch tires	600 pounds per wheel
30x4 -inch tires	550 pounds per wheel
32x4 -inch tires	650 pounds per wheel
34x4 -inch tires	700 pounds per wheel
36x4 -inch tires	750 pounds per wheel
32x4 1/2-inch tires	700 pounds per wheel
34x4 1/2-inch tires	800 pounds per wheel
36x4 1/2-inch tires	1000 pounds per wheel
5 -inch tires	over 1000 pounds per wheel

Air Pressures

	Front	Rear
3 -inch tires	60 pounds	65 pounds
3 1/2-inch tires	75 pounds	80 pounds
4 -inch tires	85 pounds	90 pounds
4 1/2-inch tires	90 pounds	95 pounds
5 -inch tires	95 pounds	100 pounds

In all cases tires should stand up round when loaded.

Tire Necessities

Inner Tires

This is the genuine Interlock Inner Tire which has been widely advertised and has made good all over the country in over a quarter million tires. The object of the Interlock is to increase the strength of the tire so as to make it blow-out proof and practically puncture proof. The result of using Interlocks is that new tires will give twice the usual mileage while old or half worn tires will give hundreds and hundreds

miles of extra service. The Interlock is a complete extra inside tire, which is easily placed between the regular casing and inner tube. It is made exactly like a tire, full, round, endless and with flaps locked to the rim so that it cannot heat or chafe and does not interfere with either speed or resilience. The construction of the Interlock makes it take the strain completely from the sides and rim of the tire as well as the tread.

Diameter tire, inches. 3 3 1/2 4 4 1/2 5 5 1/2
Price each..... \$6.10 \$7.30 \$10.80 \$12.50 \$14.20 \$15.00

Gripwell Tire Reliners

Gripwell Reliners will enable the motorist to get hundreds of extra miles of service out of tires which would ordinarily be thrown away. They will prevent blow-outs and punctures in the majority of cases. Gripwell Reliners are made of special tire fabric, several layers of which are cemented together over a mould. Being made in this way, they fit the inside of the tire snugly and do not creep or chafe when properly applied. Made full width to reach from bead to bead, the 4-inch sizes being 4 plies thick and smaller sizes 3 plies. Cement coated and self-vulcanizing when applied to tire.

Diameter tire, inches. 3 3 1/2 4 4 1/2 5 5 1/2
Price each..... \$2.50 \$3.30 \$4.30 \$5.00 \$5.10 \$5.70

Gripwell Lace-On Boot

Made from several plies of heavy tire fabric and high grade rubber stock. Made over a form, and therefore fit casing perfectly. Furnished complete with lacing. Jumbo size is extra heavy, extra strong and 1-3 longer.

Width Tire, Inches	Regular Size Price Each	Wt., Ounces	Jumbo Size Price Each	Wt., Ounces
3	\$1.10	16	\$1.60	30

5	1.60	18 1/2	2.10	38
5 1/2	1.80	20	2.30	40

Gripwell Hook-On Boot

Made with a hook which is easily adjustable to take care of the difference in size owing to different tread thickness, thus a perfect fit is assured. Has extra outside screw plate and reinforced edges, making it impossible for the hook to pull out. Overcomes every difficulty of all other types of Hook-On Boots. Packed singly in cartons, including inside patch. Jumbo size is extra heavy, extra strong and 1-3 longer.

Width Tire, Inches	Regular Size Price Each	Wt., Ounces	Jumbo Size Price Each	Wt., Ounces

5	1.60	28	2.00	36
5 1/2	1.80	32	2.20	40

Gripwell Steel Studded Boots
Hook-On or Lace-On

Is designed to meet the demand for an extra strong, inexpensive outer shoe.

An extra strip of toughest chrome leather is placed over the original layer. This, in addition to the steel studs, gives a shoe that will wear indefinitely.

Width Tire, Inches	Price Each	Width Tire, Inches	Price Each
3	\$1.90	4 1/2	\$2.30
3 1/2	2.00	5	2.50
4	2.20	5 1/2	2.65

Miscellaneous Tire Accessories

L. & L. Handy Split Rim Tool

With this tool any make of split demountable rims, either clincher or straight side type, and any size, can be removed or replaced in one minute, even though the tire is slightly undersized or rusted on.

To unlock rim. Place claws over rim flanges and again collapse until lever passes eccentric, where it remains locked until replaced.

To replace rim. Place claw ends of tool against inner surface of rim and adjust notched bar and ratchet and reverse operation until rim is forced into place.

Length, folded, 19 inches. Weight about 6 pounds.

Price each \$2.00

Johnson Tire Tool

A strong, simple, durable, powerful and practical tire tool. Rapid and efficient. Made of drop forged steel with one end designed as a hammer, the other as a grab hook or tire remover. Applies force at head of tire, the logical place and throws tire free from rim.

Furnished complete with full directions.

No. 1. Length 13 inches, weight 2½ lbs. Price \$1.50

No. 2. Length 17 inches, weight 3 lbs. Price 1.90

Springfield Tire Tool

With Rim Hook

tire. Shipping weight, 2 pounds.

Price each \$1.00

This is a very convenient tool for removing tires from the common clincher rim, detachable rim or demountable rim. Fits any 3 to 5-inch tire. Tire may be removed from a demountable rim while either on or off the wheel. Will not gouge into the rubber or tear the fabric off the

Phillips Patent Blowout Boot

Made of tough Sea Island tire fabric. Thoroughly vulcanized on a tire core and permanently shaped to the form of a tire. It completely encircles the inner tube and is as strong at the head as at any other point. It will not bulge, wrinkle or bump, and is a sure repair for rim cuts.

The lock is of special design and double clinched on the sides of the boot. The edges dovetail and lock with a pin, as shown.

Sizes, inches..... 3 3½ 4 4½ 5

Price, standard 11-inch..... \$0.75 \$0.75 \$1.00 \$1.25 \$1.50

Moisture Proof Tire Covers

This cover is easily and securely applied by simply adjusting the cover snugly about the tire. The cover locks itself, making the cover water and dust proof when placed in any position. Fits practically any make of tire by simply adjusting the buttons. A steel spring used in the construction of this cover adds to its perfect fit. Furnished for all tire sizes. Shipping weight 3 pounds. Made of black enameled duck, first quality. When ordering state size and type of tire.

Price each \$3.00

Extra for demountable or bolt-on type50

Inner Tube Bags

These bags are made of heavy duck, enameled black, and should not be confused with the light weight tube bags made of drill. Inner tubes should be kept in bags when not in use to prevent them from being chafed or cut by rubbing against sharp edged tools.

For one tube. Price each \$0.50

For two tubes. Price each80

Romort Tire Tester Attachment

Attach the Schrader tire tester to the Romort automatic air valve model "A" or "B" shown on another page.

It consists of only two parts, the barrel and cap.

Price each, without Romort valve \$1.00

Gripwell Tire Talc and Tire Mica

Gripwell tire talc is the highest grade American talc procurable for tire lubrication. When sprinkled inside the casing after making a repair, it prevents tube from sticking and eliminates all friction. Price per can \$0.20

Gripwell tire mica will not cake, harden or absorb moisture. Used to lubricate inner tubes and is undoubtedly the best powder that can be used for this purpose. Furnished in convenient sifter top cans with cap.

Price per can \$0.30

Tire-It Tire Preservative

Tire-It is a pure white rubber tire preservative, containing no oils, turpentine, benzine or any petroleum product which is highly injurious to rubber. It is easily applied with a brush, dries quickly and will not peel, blister or rub off. Adds to the appearance, preserves and protects tires.

Price per Can

1 pint \$1.00 2 quarts \$3.50

1 quart 1.90 1 gallon 7.00

Weaver Universal Tire Changer

Make a profit on your tire changes by using a Weaver Universal tire changer.

The only mechanical means ever perfected for dismounting and remounting all styles and sizes of pneumatic automobile tires.

Will handle any size and style of auto tire or rim. The most difficult tires can be changed in a small fraction of the time required by the primitive methods usually employed.

The saving in time and labor will pay for the equipment in a very short time. The more prompt and efficient service which you will be able to give your trade will soon double your patronage.

No Injury to Tires

Every operation in the handling of tires by this Universal tire changer is done by means of smooth, polished rollers. There is positively no possibility of injuring either casing or tube even in the most stubborn cases. No pounding, no jamming, no cutting.

Printed directions accompanying each machine give detailed suggestions for performing each operation on the various types of tires and rims.
Shipping weight, 275 pounds.
List price, complete.....\$44.00

"Wallace" Steel Tire Rack

A most attractive and convenient rack for storing tires of all sizes. Tires can be spaced to suit your own needs, as the moving upward or downward of the end supporting brackets is the work of but a few moments. Tires are supported on rails made of angle iron with a large flat surface to prevent flattening or injuring the tires from continued storage in one position. Additional sections or units may be added.

Made entirely of steel with upright stanchions of 2-inch tubing.

Height over all, 10 feet, 8 inches. Length over all of first section, 5 feet, 4 inches. Length over all of each additional section, 5 feet, 2 inches. Weight of first section with two uprights, 160 pounds net or 185 pounds crated. Weight of extra sections with one upright, 130 pounds net or 145 pounds crated.

Price List

First section, 3 tiers, two uprights as shown.....\$20.00
Extra sections, for extensions, 3 tiers and one upright only.....15.00
Shipments will be made knocked down.

The Hovey Automoblie Jack

Raises or Lowers Any Wheel of Any Car in One Second

This jack operates on an entirely new mechanical principle, namely, the "wheel and axle" and "shifting fulcrum" as distinguished from the screw or lever of the old style jack.

It eliminates most of the time and labor ordinarily consumed in jacking up and letting down vehicle wheels.

It operates by merely "kicking up" movable head and depressing handle.

Locks by gravity.

Lets down by merely lifting the handle.

Adjustment is made by the foot and not the hands.

Four foot handle gives ample leverage.

No screwing or lever-pumping on hands and knees.

Not conveniently carried away as a "souvenir."

Built to last a lifetime.

No springs or delicate parts to break or wear.

Made of malleable iron and open hearth steel.

Price each.....\$7.00

Weed Chain Tire Grips

The feature of weed chains is in their freedom to creep. They continually shift their position on the tire. Weed chains are attached without the use of jack or other tools. Do not wire any loose ends of side chains under the felly—cut them off.

Best material, best workmanship, carefully hardened, accurately sized, prevent skidding, afford traction, cannot injure tires.

Automobile Steering Wheels

Tilting or Stationary

Steering wheels supplied with Ford cars are only 15 inches in diameter. This wheel is 17 inches in diameter and correspondingly easier to operate.

The tilting wheel is easily tilted out of the way when the driver enters or leaves the car.

Price List

Car	Diam., Ins.	Style	No.	Price Plain	No.	Price Corrugated

Chevrolet	17	Tilting	26	3.75	27	4.50

The Marvel Spark Plug Intensifier

Positively overcomes all spark plug troubles. Prevents the accumulation of carbon in cylinders and spark plugs, produces hotter sparks and perfect explosion.

A device based on the well known principle of the wireless telegraph, that when an electric current is made to leap a gap it must gather additional force to make the leap.

The cut illustrates how the current is here made to leap from the point to which the terminal is attached to the point opposite. From there it passes with increased energy to the point of the spark plug, producing a spark of such intensity as to cause ignition regardless of the condition of the plug.

Old delapidated spark plugs with broken porcelain will spark perfectly when aided by this intensifier. One needed with each plug.

Price each.....\$1.20

We can furnish chains for single and dual solid truck tires.

Automobile Accessories

Rear Tire Holder for Ford Cars

The best rear tire holder ever made for a Ford car. It will hold two casings, or two demountable rims with casings. It is made of the best extra heavy malleable iron and steel. Will last a lifetime. Can be attached in a few minutes. Full directions for attaching to car are sent with each holder. Finished in the best grade black rubber finish. Adds to the appearance of the car by giving additional length to the machine. Strap included with each outfit.

Price.....\$5.50

Combination Rear Tire Holder for Ford Cars

An improved design with combination bracket for carrying lamp and license plate. Either tires or demountable rims may be carried, the arms positively and permanently holding them in a vertical position. The license bracket is carried firmly on the hook, and there is no possibility of breakage due to vibration. Arms made from a square steel rod, and set into bottomed sockets in the hooks. Held firmly by set screws. They cannot slip out of position. Fits both roadster and touring models, and carries either one or two tires or demountable rims. Black enamel finish. Complete with straps and lamp license brackets.

Price.....\$6.00

"Badger" Chain Lock

Every automobile should be equipped with a lock of some kind. This "Badger Chain Lock" is the most practical on the market. It may also be used to protect spare tires. Made of the best case hardened, electric welded chain, covered with a thick genuine leather casing that prevents any chafing on the finish of the car. Lock furnished is either the Yale or the American Keyless lock. Made in three lengths.

No. 11. 30-inch. Price...\$1.00

No. 12. 36-inch. Price...1.05

No. 13. 42-inch. Price...1.10

Sterling Spring Oilers

The lubricant is contained in an absorbent material held against the leaves of the spring by metal caps on each side. Two oilers, each placed about 6 inches from the center are required for ordinary springs. Very long springs of the cantilever type require 4 oilers. Most oilers should be so attached as to cover end of the shortest leaf.

This oiler is not unsightly and does not interfere with washing the car. It has proven very efficient and satisfactory.

Price each.....\$0.40

Tomahawk Spring Lubricant

It consists of a container to hold the lubricant and a double wedge spring separator. To operate, place the wedge between two leaves of the spring, and a gentle tap with a hammer drives it in. Then a turn of the container handle forces the lubricant through the wedge into the exact place it is needed. No waste of effort or lubricant.

Price, complete.....\$1.00

Tomahawk Graphit Spring Lubricant

The best for spring lubrication. Comes in tube form, convenient for filling the Tomahawk Grease Container. Positively will not evaporate. Each tube contains enough lubricant to last a car for two thousand miles.

Price, per tube.....\$0.40

Running Board Tire Holder

A Ford necessity. For carrying one or two tires and demountable rims. Supported on running board only. Finished in black enamel. Packed in individual cartons, complete with bolts, straps and clamps.

No. 0. Price each, for 1 tire...\$3.40

No. 1. Price each, for 2 tires...3.80

Automobile Springs

These springs are made of the highest quality carbon automobile spring steel. They are always equal and in most cases superior to the original springs on your car. We are in a position to make prompt deliveries and can quote very attractive prices. When ordering, state name of car, model and year of manufacture. Prices upon application.

Shaler Vulcanizers

Steam Heated Plant

Meets all requirements of garage or repair shop. Handles every sort of tube and casing repairs. Machined surface of tube plate 4 by 30 inches. Any size casing repaired by approved wrapped tread method.

No attention is necessary after lighting burner. The boiler, a copper coil, raises steam in about twenty minutes and holds it at right pressure indefinitely, a thermostat regulating the flame. Steam gauge and thermometer keep a check on the operation by indicating both pressure and temperature.

Gasoline burner furnished unless gas burner is specified. Type NPR contains complete outfit, six clamps and blocks for tube work, bead strips for rim cuts, casing clamps, tube for wrapping treads, thermometer, steam gauge and safety valve. Type N is same as above, but equipped for tube work only.

Type NPR No. 41.....\$60.00
Type N No. 41.....\$55.00

Electric Heated Plant

This plant, Type ACE, consists of the complete units Type A, Type C, and Type E, mounted on a strong tubular stand. It will do the same perfect work and has the same capacity as Type NPR steam plant—20 tubes and one casing per hour.

Type C (inside casing form) and Type E (tube plate) are permanently attached to stand and have switches to permit independent heating. Type A (outside casing form) has five feet of conducting cord with a plug which fits a socket in the stand or any lamp socket if work is to be done elsewhere on inflated tires. No special wiring needed, as the entire apparatus uses less current than a flatiron.

Simple, portable, quick heating. Each unit may be purchased and used separately.

Type ACE No. 101, weight 115 pounds.....\$60.00
For thermostat controlled D. C. equipment add.....\$10.00

Ford Tube Kit

Light and compact for easy portability. It may be carried in the tool box and used for all emergency patches. It mends quickly and permanently. The lamp will burn alcohol or gasoline, does not produce smoke or soot. If accidentally overturned it would not cause trouble. Any tube can be mended without pinching the edges. Vulcanizing surface ten square inches. Handle is detachable. Outfit is packed in a small box for carrying in car. Complete with repair material. Nickel plated.

Price each.....\$1.75

Ford Combination Kit

Compact, reliable and efficient, mending all cuts and injuries as perfectly as the most elaborate outfit. Tire can be mended while inflated. Simply fill the cut with new rubber, clamp on the vulcanizer, fill the generator with gasoline or alcohol and light it. No watching or regulating. No smoke, no soot, no exposed blaze. Can be used close under the fender without damaging the paint. Permanent repairs are made as quickly as a patch. Detachable handle, always cool. Furnished with repair rubber and cement. Nickel plated.

Price each.....\$2.75

Tube-Kit Vulcanizer

For Inner Tubes Only

To be carried in the tool box for emergency repairs; mends all tube injuries quickly and permanently. As simple and easy to use as a temporary patch. The correct amount of heat is produced by a lamp which burns gasoline or alcohol, without smoke, soot or exposed flame. Accidental tipping over of the vulcanizer when in use would not cause trouble. A measure graduated to give the proper charge is furnished with the vulcanizer so that no watching or regulating is necessary. Vulcanizes a surface 10 inches square. Complete with repair material. Weight 4 pounds.

Price complete.....\$2.00

Vul-Kit Vulcanizer

For Tubes and Casings

Besides making every practical kind of tube repairs, the Vul-Kit has a 3 1/2 x 4-inch surface curved to fit any sized casing. This is very valuable because while tubes are only mended when the tire goes flat, casings always need attention. It is easy to mend a small cut while tire is on the wheel. Simply fill the cut with rubber, clamp on the vulcanizer, and in a few minutes you have a permanent repair. This vulcanizer produces no exposed blaze, it can be used close under a fender without scorching the paint. It is nicked and polished, packed with repair material in a strong box for carrying in tool box of car. Weight about 5 pounds.

Price complete.....\$3.50

Positive Combination Steam Vulcanizer

Repairs Both Tubes and Casings

A complete steam vulcanizing plant, put up in a box, so that it may be carried in a tool kit of most any car. It is a high grade vulcanizer and repairs blowouts, stone bruises and glass cuts in any size casing or inner tube as perfectly as a large steam plant. The same scientific method of vulcanizing by steam is used that all tire manufacturers employ and it can not burn or undercure.

The outfit consists of a metal body with a compartment for water and another for fuel. The water compartment is between the tire and flame, where it equalizes the heat generated and vulcanizes a patch that actually becomes a part of the tire. It is absolutely automatic and extinguishes itself after the work is completed. It is safe, clean and so simple that there is nothing to wear out or get out of order. Can be used anywhere, along the roadside or in the garage. The tire need not be removed from the wheel, nor deflated to repair casing.

To operate, place repair rubber in place and clamp on vulcanizer into which is put a measure of water and a measure of gasoline. Light the gasoline. In 20 minutes the fuel will be burned out and the repair is made. Repairs a damage up to 7 inches square.

A complete vulcanizing outfit is furnished with each vulcanizer, including a measuring cup, steel protector hood, special wood block for repairing tubes, scissors and a quantity of tube and casing rubber.

Price complete as described above, weight 4 pounds.....\$5.00

Positive Steam Tube Vulcanizer

Repairs automobile, cycle car, motor-cycle and bicycle tubes. This is the only small steam vulcanizer made expressly for tubes. Will repair a hole up to 12 square inches in any size of tube, in one operation. A water compartment between tube and fuel compartment insures perfect repairs and eliminates all danger of burning, overcuring or undercuring. Outfit is packed in a box with measuring cup, screw, sand, paper, scissors and repair gum. Weight 3 pounds.

Price complete.....\$2.25

Marvel Junior Vulcanizer

Efficient, dependable. Although it is small enough to be put in the pocket it is large enough to permanently mend any puncture. It is by far the most

economically operated vulcanizer on the market. To operate, simply place one of the cartridges in the holder, light it with a match and go away and leave it. In fifteen minutes the tube is perfectly vulcanized. Six rubber patches and 6 cartridges supplied with each vulcanizer. Price each.....\$2.00 Box of 12 extra patches and cartridges.....1.50

Adamson Universal Vulcanizer

For Tubes and Casings

A practical vulcanizing outfit complete with repair gum ready for instant use. Tire is repaired without deflating or removing it from wheel. Absolutely automatic. Place the patch, clamp the vulcanizer, put in the gasoline and light it. When fuel is burned out, repair has been made. Model U, weight 4 pounds.

Price.....\$5.00

Adamson Model T Vulcanizer

For Inner Tubes Only

No cement or acid is used. The repair gum is placed on the tube according to directions supplied with each outfit. The vulcanizer is applied by simply clamping it centrally over the gum and tube as illustrated. To vulcanize the repair, one ounce of gasoline is placed in the vulcanizer and ignited. The fuel is allowed to burn itself out and the repair is completed. Furnished with complete outfit as illustrated.

Model T. Weight 4 pounds. Price.....\$3.50

Marvel Senior Vulcanizer

For Repairing Tubes and Casings

Puts on a patch as easy as you light a match.

A chemicalized heating element used as a fuel furnishes the right amount of heat to make a perfect repair. Works under all conditions. Wind cannot blow it out. Repairs a cut in a casing in half the time it takes to remove it from the wheel. Repairs a tube in five minutes. Money back if you can afford to be without it. Complete with instructions and sufficient material to make a large number of repairs.

Price each.....\$4.00

Gums, Patches, Cement and Vulcanizing Supplies

Gripwell Raw Gum Repair Stocks for Tubes and Casings

It is useless to spend time and money making repairs to casings and inner tubes by using inferior raw gum stocks, as they will not be permanent. The Gripwell gums will enable the vulcanizer to make the very best repair possible. They are higher in price than some gums on the market, but we only care to compete in quality. They are strictly first quality and will give entire satisfaction.

ket, but we only care to compete in quality. They are strictly first quality and will give entire satisfaction.

Gripwell Tread Gum

For repairing tread cuts, putting in new sections of tread or complete retreading. Furnished in $\frac{1}{4}$ and $\frac{1}{2}$ -pound rolls in air tight cartons.

	Price per Roll	
$\frac{1}{4}$ -pound.....	\$0.54	$\frac{1}{2}$ -pound.....\$0.90

Gripwell Combination Tube Gum

When a tube is so injured as to require a large patch, the repair should be vulcanized. Gripwell Combination Gum is so called because one side is semi-cured and the other cured. The semi-cured side forms the inner surface of the patch. No sticking to the other side of the tube. The advantage of this is apparent to the repair man at once. Furnished in $\frac{1}{4}$ and $\frac{1}{2}$ -pound rolls packed in air tight cartons.

	Price per Roll	
$\frac{1}{4}$ -pound.....	\$0.65	$\frac{1}{2}$ -pound.....\$1.20

Gripwell Tube Gum

This gum is used mostly in connection with the Combination Gum described above. It is uncured. When the inside patch has been made with the semi-cured gum, the cavity or outside depression is filled with this gum and the complete patch then vulcanized. A tube so repaired is stronger at this point than the undamaged part of the tire. Furnished in $\frac{1}{4}$ and $\frac{1}{2}$ -pound rolls in air tight cartons.

	Price per Roll	
$\frac{1}{4}$ -pound.....	\$0.65	$\frac{1}{2}$ -pound.....\$1.15

Gripwell Cementless Tube Patches

These patches are red in color and made of high quality para rubber. They may be attached without the use of cement. Simply moisten one side with a little gasoline, press firmly over place to be repaired, allow to dry for a few minutes and tube is ready for use. There are 12 patches in a box in varying sizes from which the suitable size for the injury is selected. Made with feather edges, lined with coating of self-vulcanizing rubber protected with muslin to prevent rubber from drying out. Weight, 5 ounces.

Price per can.....	\$0.90
--------------------	--------

Gripwell Breaker Fabric

This strong fabric is of open weave, filled with gum of great adhesive quality. Its use is a strong insurance against tread separation, forming a weld between tread and lower layers that make the sections a perfect unit of strength. This breaker fabric also acts as a shock absorber and distributor, protecting carcass from concentrated strains.

No. 2098. Frictioned on two sides. Price per 1-lb. can. \$2.20

Oval Valve Bases

These valve bases, when cemented down properly, will prevent valve leakage. Small size is intended for 3 and $3\frac{1}{2}$ -inch tires. Larger size is for 4, $4\frac{1}{2}$, 5 and $5\frac{1}{2}$ -inch tires.

Large size, price each.....	\$0.30
Small size, price each.....	.20

Gripwell Pure Gum Vulcanizing Cement

Made of raw para rubber and contains absolutely no rosin. Cures quickly and secures perfect results with any vulcanizing method. The best patch or repair stock and the most expert repair men are helpless, if cheap commercial or homemade cement, both made by guess work, are used. Gripwell cement will give entire satisfaction if properly used. Furnished in $\frac{1}{4}$ and $\frac{1}{2}$ -pint cans.

Price per Can

$\frac{1}{4}$ -pint.....	\$0.20	$\frac{1}{2}$ -pint.....\$0.30
--------------------------	--------	--------------------------------

Gripwell Rebuilding Fabric

Light in weight, but is stronger than any requirement of service will demand. Frictioned with extra high quality rubber compound. Packed in 1-

pound air-tight cans.

No. 8498. Frictioned on two sides, skim coat on one side. Price per 1-pound can.....\$1.80

No. 8498BB. Frictioned on one side. Price per 1-pound can.....\$1.80

No. 8482BB. Frictioned on one side. Price per 1-pound can.....\$1.80

Loctite Canvas Patch

Before Patching

After Patching

A cold patch that will repair any size cut in tube and can be used as an emergency repair for broken fabric in casings.

Loctite is built to resist the highest air pressures and hottest roads. Can be applied by anyone in five minutes. No experience. No tools needed to repair with loctite. Cut patch to fit your puncture and just stick it on. The tube can be used immediately. Will not dry off when carried in car.

Outfit No. 1—Contains one sheet of Loctite, 6x18 inches, tube of cement, emery paper, etc., sufficient to repair 250 nail punctures. Price complete.....\$1.60

Outfit No. 2—Contains 54 square inches of Loctite, sufficient for 100 repairs. Price.....\$0.90

Outfit No. 3—Contains 27 square inches of Loctite. Price.....\$0.50

Dutch Brand Products

Dutch brand rubber and rim cements are made of the finest grade of pure Para rubber combined correctly with the highest quality chemicals obtainable. The exclusive and patented system of closing the tubes insure them against leakage and evaporation.

Rubber Seal

The most efficient medium for repairing cuts, gouges and blow-outs in casings, punctures in inner tubes, etc. Can also be used on rubber boots and shoes, garden hose and rubber articles of all kinds.

Outfit consists of a 2-ounce can of high grade rubber cement and a sheet of emery paper, put up in a neat metal box bearing full directions for use.

Rubber Seal outfit complete. Price each.....\$1.20

Two-ounce can of Rubber Seal cement only. Price each.....\$0.60

2 in 1 Tread Filler

A semi-liquid rubber compound for repairing small cuts in casings. It is a scientific combination of pure gum and rubber cement, so that in one operation results are obtained which ordinarily require the application of two materials.

On exposure to the air it dries very quickly, producing a tough but resilient plug, or patch, equal in strength to the tire itself.

Put up in 1x6-inch tubes with nozzle point.

Price per dozen.....\$5.70
Price each......60

Tire Fluid

Stops Leaks in Tires

It makes tires puncture proof. For small leaks it works like magic. Do not wait for a puncture. Insert the contents of one tube in each tire.

It will not crystallize, freeze nor decompose. It is suitable for use in all climates and renders the tire practically puncture proof.

Put up in 4-ounce collapsible tubes.

Price per dozen.....\$3.20

\$3.00

Misto Kloth

These soft, scratchless, ready-cut Kloths bring out the hidden lustre of the finest finish. They make the finest finish more lasting. They make cleaning and polishing easier, quicker.

Package of 12 pieces. Price per package.....

\$1.00

Channon's Neatsfoot Oil

For oiling, softening and preserving automobile clutches. Keeps clutches soft and pliable, prevents slipping and possible accidents. Keeps clutches in a safety first condition. Also fine for preserving leather, harness, straps and cushions and all leather articles.

1-pint cans. Price each.....\$0.70

Channon Signal Oil

Especially prepared for auto side and tail lamps. Will not blow or jar out easily. More economical to use than kerosene oil. Safe and reliable. Gives a bright and penetrating light. Used by the railroads for switch and signal lights.

1-quart cans. Price each.....\$0.70

Channon Spring Leaf Lubricant

Composed of finely powdered graphite, ground mica and a special lubricant that sticks to the leaves of the springs while under pressure. Does not squeeze out. Made on the same principle as the "Spring Insert" lubricant, but not so hard, making it easy to use.

4-ounce tin box. Price each.....\$0.80

Channon Valve Grinding Compound

Ready for use as it comes in the box. This is a fast cutting compound and will give first class results if used as directed. Leaves no marks or rings on the valve seats. Put up in duplex cans. Medium and fine.

4-oz. can. Price net.....\$0.60

Channon Carbon Remover

Positively harmless, no matter how often used; attacks nothing but carbon and baked grease; cleans cylinders, piston rods, spark plugs and valves; no heat no burn cylinders; cheaper than burning with oxygen; gives immediate increase in power and speed—never fails.

1-quart cans. Price each.....\$2.00

1-pint cans. Price each.....1.00

Dustless Auto Duster

Made of chemically treated yarn, strongly twisted in between two galvanized wires of great strength, and mounted in a substantial handle enameled black. Instead of spreading the dust this dustless duster gathers and holds it. Can be washed without injury. Duster part 10 inches long, width, 8 inches; length overall, 16 inches.

Price each.....\$1.50

Flash Hand Cleaner

For removing dirt, grease, oil, paint, ink and stains of all kinds from the hands.

Cleans better and quicker than soap and leaves the skin absolutely clean and free from injurious and unhealthy matter.

Paste form, in tin cans weighing one pound.

Cases, 3 dozen cans, each full 18 ounces. Per case.....\$5.50

Cases, 1 dozen cans, each full 16 ounces. Per case.....2.00

Single cans, full 16 ounces per case. Price each......20

In ordering single cans send postage for mailing via parcel post.

Blue Ribbon Metal Polish

It requires no shaking, always remaining in suspension. Is sufficiently thick to prevent waste.

Used on all parts made of copper, brass, etc.

Channon Castor Oil Compound

Pure castor oil is not adapted for motor car lubrication because of its heaviness and peculiar adhesive properties, but when combined in the correct proportions with other oils it makes one of the best auto lubricants. Castor Motor Oil gives great compression and positive lubrication at all speeds and temperatures. Having no close affinity for gasoline, it does not soon burn up and carbonize. One pint treats 5 gallons oil.

1-pint cans. Price each	\$1.50
-------------------------------	--------

Bullock Tire Pumps

Single Cylinder Tire Pump

This is one of the most powerful single cylinder pumps manufactured. It will force air against a higher pressure than most pumps of its type. This power is secured by the use of an injector cylinder of special design, equipped with two plungers. An ideal pump for 3-inch tires. Length over all, 25 inches. Connection, 20-inch 3-ply hose and auto nipple. Weight 4½ lbs. Price each.....\$2.00

Two Cylinder Tire Pump

A special pump of stocky design that will pump air almost twice as fast as a one-cylinder pump with the same effort. Workmanship, material and design are of the highest quality. Length over all 20 inches. Connection 24-inch 5-ply rubber tubing and auto nipple. Weight 6 pounds. Price each.....\$2.75

Three Cylinder Tire Pump

This pump will inflate tires in 30 seconds. Works easily against full tire pressure. The air flows into the tire in a constant stream with infinitely less effort than almost any other pump on the market. Length over all 22 inches. Connection—30-inch 5-ply rubber hose and a special quick operating auto nipple. Weight 8 pounds. Price each.....\$6.00

Bell Plunger Tire Pumps

Single Cylinder

This long, single cylinder pump is sure to give satisfaction wherever placed. It is a well known fact among garage men and mechanics that a single action pump is the most practical kind when it has a perfect plunger. The Bell plunger is mechanically perfect, and never fails to give the maximum of service at all times. Has 22 in., 20 gauge cylinder, brass top, heavy cast base with folding stirrup, 2 feet of 5-ply hose with nipple. Black enamel finish. Price.....\$3.75

Single Cylinder, Jr.

This pump is a duplicate of the Bell Pump, but is made shorter for convenience in putting into tool box. It is designed for emergency work, and the quality of its material insures long and satisfactory service. The advanced principles in plunger construction used on this pump are unexcelled.

18 in. 1¼ in. by 20 gauge cylinders. Brass cast top and base, Bell expanding plunger, 18 in. 3-ply hose and nipple. Finished in black enamel.

Price.....\$2.50

Double Cylinder

This compound cylinder model is one of the most substantially built pumps made. Being supplied with the Bell Expanding Plunger, it will outwear the best. Produces nearly twice the pressure of a single cylinder pump with the same amount of effort.

20 in. high, with 2 cylinders 1½ in. and ¾ in. by 18 in. long. Heavy cast top and base. 18 in., 3-ply hose and nipple. Finished in black enamel.

Price.....\$3.00

Pitner Pumps

Single Action

The only means of inflating tires that is dependable at all times and at all places. Every other method has its weakness. Examine the features of this pump and try to find one. The handle is a piece of hard wood, driven into a solid brass collar, then the piston is screwed through both of them—the strongest possible construction. Tempered tool steel bearing in the cap around the piston rod—an exclusive feature that compels piston to run square with barrel, working easily, always air tight. The leather piston rings fit into a groove around the piston instead of the old-fashioned cup washers. The air cushion formed after the piston passes the outlet holes insures an easy finish to the stroke and prevents jars. The oil retaining pad at bottom of barrel keeps oil from rotting hose or tires. Length 22 inches.

Price each.....

\$4.50

Double Action

To those who prefer a more powerful pump, that will inflate a tire more quickly than a single action pump, we recommend the double action pump. No other hand tire pump will produce a volume of air equal to that delivered by the Pitner Double Action Pump. You will be astonished by the ease with which high pressure can be reached with this pump, without the straining and jerking common to most compound pumps. That's because its construction is mechanically correct—it is different from all other pumps. It throws air on both up and down strokes, making a continuous stream. Finished the same as the single action pump and containing all the same improved features. Length over all, 22 inches. Stroke 18 inches.

Price each.....

\$5.00

Automobile Tire Pumps

Mayo Spark Plug Pump

A thoroughly reliable pumping plant which can be instantly attached to all four-cycle motors of two, four, six, or eight cylinders and will inflate the tire with fresh, pure air in from two to four minutes, depending upon size of tire and pressure. Guaranteed pressure obtainable of 100 pounds and over. Can be attached to any car in an instant and the cost of the pump is the last cost; there are no further supplies to be bought. It is small, compact and light, weighs but 2 1/2 pounds and can be carried anywhere. Noiseless in operation, non-adjustable, requires no attention whatever. Outfit consists of pump with adapter to fit any car, 12 feet of hose with connections and guaranteed accurate pressure gauge installed in the hose, everything ready for use. Price complete.....\$16.70

Price each.....\$21.00

Brown Impulse Tire Spark Plug Pump

This pump works on the compound principle, inflating the tire with absolutely pure, cool air. The action which prevents the taking in of gases is due to the breaking up of the vacuum of the motor by the special breather valve. This has a tension of 3 ounces, the ordinary motor having about 5 feet of vacuum. The atmospheric pressure of 15 pounds per square inch immediately overcomes the vacuum and the pure air rushing into the cylinder takes the place of the gasoline vapor. It requires but half a minute to attach the Brown Air Pump to the engine. Suitable for any four-cycle engine. Furnished complete with pump, gauge, hose and connections. Price each.....\$21.00

Brown Q. D. Spark Plug

This spark plug is made especially for use with the Brown Tire Spark Plug Pump. Can be instantly removed and inserted. Makes a fine priming spark plug. When ordering state size wanted. Price each.....\$2.00

Brown Jr. Impulse Tire Pump

This pump operates exactly on the same principle as the Brown Pump described above, in fact is identical in every respect, except in size and length of hose; and does not have an air gauge. Specially adapted for use on small cars, such as the Ford, Saxon, Metz, etc. Price complete.....\$9.90

Mayo Ford Pump

A diminutive Mayo Spark Plug Pump built especially for the Ford car. A real power tire pump which inflates tires with pure, fresh air; 32x3 size to 65 pounds pressure in 2 minutes; 32x3 1/2 size to 70 pounds in 3 minutes. Attached and used exactly like the standard Mayo Spark plug Pump. No wearing parts to break or get out of order. Fitted with 1/2-inch connection, 10 feet of good hose, accurate gauge and connections. Price complete.....\$12.50

Price complete.....\$12.50

Stewart One Cylinder Air Pump

Furnished Complete with Gears and Brackets for Any Make of Car

This pump is mounted right on the motor and operated by moving one lever. It is light in weight, the base being made of aluminum. The bore is 1 1/4 inches; stroke 2 1/2 inches; length of piston 1 1/4 inches, making an extra long bearing. Crank shaft is hardened and runs in hardened steel, not bronze bearings. It is fitted with oil conductors but requires no surplus oil in the crank case. The piston is lubricated by means of a wick or wiper system, the oil being applied from the outside of the pump. The bottom of the crank case is open so that in case there should be the least amount of free oil it will immediately drop out. Note will be carried up with the air into the tires. The cylinder is not a casting, but a machined job and is constructed with lines to insure plenty of cooling surface. The air is protected with a double ball valve, so that in the event that dirt should hold one of the valves open the other valve would be sure to act and in this way cause no loss of air. With the pump is furnished a gear shift, all necessary gearing and brackets for attaching to any make of car, 13 feet of hose, a tire gauge and connections. Dimensions: Length 6 inches; height 6 1/4 inches; width 4 inches. Weight 5 1/2 pounds. When ordering state the make, model and year of manufacture of car for which pump is desired, so that the proper gearing may be furnished. Price complete as described above.....\$12.00

Price complete as described above.....\$12.00

Inland Lever Auto Pumps

The Inland is strong, durable and efficient. Constructed of the best grade materials throughout, it will withstand any strain or rough usage and will last a life time. It is the only pump made with folding handle and clamp. Simplicity itself, the pump has screw locked cylinder cap, which can be instantly removed, if necessary, by making half a turn to clean the piston.

The cylinder, size 3 by 6 1/4 inches, is brass. Piston stroke 5 1/4 inches. Frame and handle made of malleable iron, which cannot snap off. Thumb screws are made of steel as well as all bearings.

To operate, attach hose to pump valve with the gauge right before you, enabling you to know the exact tire pressure. Throw the weight of your body on the handle with extended arm, and in this manner even a frail person or child can easily inflate a tire to ninety pounds pressure. This will mean increased mileage for the tires, and money saved. Carry an "Inland Lever Pump" with you and occasionally register the air pressure. It will do this so quickly and easily that the cost of the pump becomes a mere fraction of the money you save. Fold up compactly to go in tool box. Eight feet of heavy Mercuro hose furnished with pump. Price with gauge.....\$6.00 Price without gauge.....\$5.00

INLAND I-X-L PUMP
HANDLE PARTLY FOLDED

Automobile Accessories

Twitchell Tire Gauge

Also known as the pencil gauge, as it is very small in thickness. It can be used when the wheel is in any position. It is provided with a new positive lock stop and stays up so that the pressure may be read after gauge has been taken off the valve. The Twitchell Gauge will indicate the true pressure or none. Sent postpaid anywhere.

Price each \$2.00

Pump Tubing

First quality rubber and fabric construction pump tubing, furnished in the sizes priced below.

Price per ft., $\frac{1}{2}$ -in. \$0.20

Price per ft. $\frac{1}{4}$ -in. .24

Hose Bands

To fit small pump hose.

Made of all brass.

Pump Gauge

Attaches to pump usually at the bottom for permanent use. Dial is $1\frac{1}{2}$ inch diameter, registers to 150 lbs. Back or bottom connection furnished; $\frac{1}{2}$ -in.

I. P. Thru. Nickel plated.

Weight 6 ounces.

Price each \$1.75

Power Pump Gauge

For power and spark plug pumps. To attach, cut hose and insert gauge about 18 in. from tire valve connection. Hose should have a connection like our No.

46. Weight 6 ounces.

Price each \$1.75

Combination Tire Tester and Pump Gauge

To use as a tire tester, simply press gauge down over tire valve and pressure will be indicated. To use as a tire gauge simply unscrew the little cap off the extending arm and attach hose connection. This is a very accurate and sensitive gauge, well made throughout. Highly nickel plated finish. Dial $1\frac{1}{2}$ inches in diameter. Weight 8 ounces.

Price each \$2.50

A heavy substantial screw connection with fibre washer which cannot be lost or blown out, but can be replaced when worn out. For $\frac{1}{4}$ -inch air pump tubing

Price each \$0.15

Romort Automatic Air Valves

Style A

The Romort valve, style "A", is the most

popular valve in use for heavy work. It is made to fit any size tubing. It is practically indestructible, being made of solid bronze. Positively air tight. Instantaneous in opening and closing. All parts (with exception of rubber gasket) guaranteed to wear one year.

Weight, 9 ounces.

Price each \$3.00

Style B

This is a high grade valve constructed to meet the popular demand for a light and inexpensive automatic air device. Solid bronze, one piece casting, universal stem will fit any size tubing. Automatic opening and closing. Suitable for public service stations, repair shops, etc.

Weight 5 ounces.

Price each \$1.00

Romort Angle Pump Connection Not Automatic

Solid bronze casting made for direct connected air compressors of all types power, tire and spark plug pumps attached to automobiles. Stem fits tubing from $\frac{1}{4}$ to $\frac{3}{4}$ of an inch.

Price each \$0.40

Gripwell Hose Nipple

A perfect slip-on connection that stays on. When applied to tire valve, a quarter turn locks it on valve and it will not pull off until intentionally released. Made extra heavy of all brass.

Price each \$0.50

Straight Pump Connection

One piece casting of solid bronze. For use on direct connected air pumps, hand and foot pumps. Fits tubing from $\frac{1}{4}$ to $\frac{3}{4}$ of an inch. Rubber washer.

Price each \$0.25

Invincible Tire Tester

The Invincible Tire Pressure Tester is the only one made that shows the pressure that should be maintained in tires of various sizes. The dial is engraved for that purpose. Made on the principle of a steam gauge with a seamless bourdon brass tube. Shaped like a watch to fit your vest pocket.

Price each \$2.50

Channon Samson Spark Plugs

A real spark plug that sparks always and never fails. Made with real stone tops—not porcelain—and practically unbreakable.

Has double gap always insuring a stream of fire that is more than a spark.

Guaranteed forever against imperfections in manufacture.

Made in all sizes and for all makes of cars. Equal to any plug on the market, regardless of price.

Equip your car with Channon Samson, everlasting, sure shot spark plugs, and avoid sparking troubles.

Price each \$1.00

Overland 1/2-inch Standard

3/8-inch Standard Buick

Golden Giant Spark Plugs The Gold Plated Plug

There's 14 years' experience behind this great plug—that's why it's the leader of them all!

Features of the Golden Giant are as follows:

1. **Blue Adamant.** This is the name of the insulator; it is a name that means strength to the very last. The blue adamant won't break—it won't be affected by heat, and it'll last forever.
2. **Special Copper Asbestos Gaskets** that hold the heaviest compression, never leaking.
3. **Pure Nickel Electrodes** that will never burn, corrode or warp.
4. **A Life Time Guarantee** that goes with every plug we sell.

Because the Golden Giant is made so good, we gold plate every one, thereby distinguishing it from the ordinary spark plug.

Every plug packed in a handsome, individual metal container.

Price..... \$1.00

Sizes: 1/2-inch—Metric—3/8-inch x 18.

Special sizes for Overland and Buick motors.

Regular 3/8-inch plug adaptable for Ford motors.

Champion X Spark Plugs Special 3/8-inch

The Champion X is a special Ford plug with gun metal finish. Adopted as standard factory equipment on the Ford car since 1911.

The Herz Plug

The insulator is of blue enamel stone in two parts. The inner is tapered and ground, gas-tight, into the steel fitting. No packing is used. The inner stone slightly tapers toward the electrode, forming an explosion chamber behind the electrode. The soot is blown out by each explosion, making it self-cleaning.

1/2-inch Ford

Rayfield Carburetors

The best carburetor on the market. All workmanship and material of the highest class. Two simple adjustments, one for low, and one for high speed, control the supply of gasoline. Model "G" has three air intakes—the constant, or fixed air opening, and two automatically controlled air valves. These are interconnected, and operate together in harmony with the motor suction. Fuel is supplied through two nozzles. Designed to meet the requirements of low quality gasoline now sold. It makes easier starting, a lower throttled motor, a faster getaway, more speed, greater power on the hills, more flexible motor, and saves from ten to fifty per cent fuel. Easily adjusted to any car.

Sunderman Vacuum Carburetor

A highly efficient low priced, carburetor of universal application designed to take care of the low quality of gasoline now used. The vacuum principle of carburetion is scientifically correct.

The Sunderman carburetor produces a pure, dry gas, leaving no carbon deposit, eliminating valve grinding and the fouling of spark plugs. It gives a uniform mixture and unvarying results.

Has no wearing parts. Simple in construction—20 parts, as against 100 to 150 parts in other carburetors.

Price, for Ford cars.....\$5.00

Price, for other cars.....6.50

Farmer Mixing Valve

For stationary and portable gasoline farm engines—bit and miss type. The valve body is made of bronze, the disc or poppet valve of a special composition to prevent breakage.

The illustration shows right hand valve. Left hand valve is furnished at same price.

All valves are furnished with 1/4-inch female pipe at "D" unless otherwise order.

Price each.....	\$2.86	\$3.62	\$4.40	\$5.24	\$6.60

Pet Shock Absorbers

For Ford Cars

Designed especially for the Ford car—time tested and efficient.

It is extremely simple—a slotted spring cage with two bolts, displacing the Ford shackle bolts, makes the attachment. Inside the spring cage is a sturdy helical spring of finely tempered steel carrying the weight of the car, cushioning, and smoothing out every irregularity of the road. Inside the big spring is a smaller compensating spring—wound in the opposite direction and assisting the main spring.

When the Ford receives a severe jolt, the rebound is checked by a spur so designed that it brings the entire capacity of both springs into action, absorbing the rebound and giving the occupants of the car practically a floating sensation. All working parts are of heat treated steel made to stand abuse.

Per set, rear only.....\$10.00

C. C. Shock Absorbers

Cut Down Your Tire Expense

By equipping your car with a set of C. C. shock absorbers you effect an immediate saving in tire expense; you can keep your tires inflated to standard pressure—keep them always on the road, not bouncing up and down, wearing and tearing. A motor pulls stronger with well rounded tires, but the car owner invariably cuts down the pressure to add to his comfort, increasing his tire expense and strain on the motor. In addition to this, your car is freed from the continual rattle and strain on all parts.

For Ford cars:

Price per set of two.....\$10.00

Stewart Vacuum Gasoline System

The Stewart Vacuum gasoline system consists of a small tank, 4 1/2 inches high; installed under the hood on the dash or motor and connected to the manifold, carburetor and gasoline reservoir supply. The suction of the motor through the manifold draws the gasoline from the rear reservoir to the small tank under the hood, from which the gasoline falls in a positive, even flow to the carburetor. No preliminary hand-pumping air into gasoline tank before starting car. No depending upon a motor-driven air pump to keep up the pressure after starting. No air gauge to watch; no air lines to keep tight; no air tight connections necessary anywhere. Supplies gasoline to the carburetor unaidingly, under all conditions, even on the steepest grades, because of its being located so close to and above carburetor. Actually saves 10 to 15 per cent gasoline. Requires absolutely no attention after being installed. The Stewart Vacuum gasoline system can be installed on your present car, whether new or old, by any garage man. When ordering always state make, model and year of car.

Monarch Timer for Ford Cars

This is the only guaranteed timer manufactured today. The big point of superiority in the 1916 timer is in the construction of the interior. The old pivoted style has been discontinued as it will skip on uneven contacts, forming waves. Our new patented interior makes a direct drive against the contacts, giving a positive contact. The Monarch interior takes up any unevenness, passes smoothly over all contacts, and gets the greatest power out of your motor. Wearing parts are made of extra fine materials and the greatest care is used throughout.

Extra interiors can be furnished if necessary.

List price.....\$1.25

L & L Grease Retainer

For Ford Cars

This device is one of the most important and essential that has been invented for automobile improvement—it prevents accidents. It keeps grease from the brake shoes and drum. It prevents grease from splashing tires, which causes costly deterioration. It gives assurance that the

differential case is full of grease, relieving the constant fear that gears may go dry. It prevents grease from running down through the brake drums and splashing over the body giving a dirty and untidy appearance to the whole car.

It will never need to be replaced—will outlive the car. Can be easily and quickly installed.

For medium grease use one pair, one on either side of the car. For light grease use two pairs, two on each side of the car.

Price per pair.....\$1.60

Running Board Steel Mat

The spring attachments are so arranged that by lifting off the ends of the springs the mat can be rolled over and the running board thoroughly cleaned and dried. This insures the running board underneath from becoming smeared, discolored or rotted, as is so liable in using cocoan and other stiff mats.

Don't soil the rug and robes inside your car.

Use an Acme running board steel mat, clean and sanitary.

Two sizes:

No. A. 7 1/2 x 9 1/2 inches.....\$1.00

No. B. 8 1/2 x 14 1/2 inches.....1.35

Heissler Starting and Lighting Batteries

For Gasoline Cars

"A battery with the troubles left in the factory." These batteries have a much greater capacity than that of ordinary makes, and a very liberal acid space in conjunction with an excellent splash chamber which positively prevents slopping and leaking of electrolyte.

Plates are an improved type, and have proven superior to anything that has been offered for starting and lighting purposes. Buckling, abnormal sulphating and the shedding of active material have been entirely eliminated.

All connections lead burned and the elements carefully locked in high grade rubber jars. These are completely surrounded with a cushion of resilient and acid resisting sealing compound. The outside container is constructed of an especially prepared and treated wood. All materials used in the construction of these batteries are of the highest grade obtainable on the American market.

Prices for other makes of cars upon application.

No. 6 Dry Storage Battery

It has greater output in watt hours per pound and has longer life in cycles of charge and discharge than any other battery known.

Battery troubles characteristic of all other makes are eliminated.

A comparative test between the No. 6 dry carbon battery and No. 6 dry storage battery shows that the latter is ten times better in watt hours. It is superior for all uses, especially for heavy duty.

It holds its charge longer and can be recharged indefinitely for much less than the cost of a carbon battery. It has 50 per cent higher working voltage, 600 per cent greater watt hour output, ten times greater working capacity.

Price.....\$4.00

Break-Not Battery Syringe Hydrometer

It enables you to determine the exact condition of battery and is also useful in transferring the liquid to and from battery and adding fresh water or acid.

It will not break if dropped to the floor and is easily taken apart and cleaned.

Its accuracy is guaranteed. The bulb is made of best red rubber and of ample capacity. Shipped in a strong non-collapse mailing tube.

Price each.....\$1.00

Security Switch Lock

For Ford Cars

High class construction.
Absolute protection of the car.

Simple and easy to install.
The most efficient and attractive protecting device we have to offer.

The regular Ford switch is retained without disconnecting or changing any electrical connections, or removing bolts.

It is installed by removing the name plate and attaching with three screws which are concealed and protected. It is impossible to remove the lock or switch in any manner. Two keys are supplied, and the switch, together with plate, are heavily nickel plated.

Price each.....\$3.00

No. 6 American Ignition Dry Cell Battery

These cells are scientifically made under the supervision of experts, and carefully inspected and tested several times before leaving the factory. Can be furnished in round or square cartons.

No. 40. Without brass protection......40

No. 41

Valveless Bucket Pump

A necessity in every well equipped garage, oil station or repair shop.

Its valveless construction permits lubricants to be handled in "three ways."

First.—The lubricant can be forced out of the bucket and into the desired receptacle.

Second.—Grease or oils can be sucked out of the differential, transmission housing, etc.

Third.—The barrel or chamber of the bucket may be sucked full of foreign lubricant and discharged again through the hose into a third receptacle without disturbing the contents of the bucket.

Self-measuring, ten full strokes of the lever handle discharge exactly one quart of light lubricating oil. Bucket is made of sheet iron. Barrel is of brass tubing. Equipped with $\frac{3}{4}$ -inch flexible steel hose. Capacity 25 pounds of grease.

Price.....\$12.00

Walker Auto Manifold Lock

Absolutely prevents any mixture from entering the manifold from the carburetor, making it impossible to run the car. When open it acts as a mixer in breaking up the gasoline and allowing only the desired quantity to be used. Specify make, model and year of car.

Price.....\$2.00

Sterling Pocket Battery Meters

A reliable battery meter is indispensable to owners of home electric lighting outfits and to users of gas or gasoline engines, whether in the operation of machinery or motor cars. The battery tester is invaluable whether dry or storage batteries are used. These are the latest improved magnet type.

Ammeter No. 24

When a group of dry batteries are discarded several good cells may be thrown away unless each is tested separately. One weak battery might otherwise condemn all.

Scale 0-30 amperes. One ampere divisions.
Price.....\$1.50

Volt Meter

Applied when a storage battery is furnishing current, it gives just as reliable indication of voltage and condition of battery as an expensive dashboard voltmeter.

No. 34. 0-18 volts. Price.....\$1.25
No. 34A. 0-16 volts.....1.75
No. 34B. 0-30 volts.....2.00

Voltammeter

A combination of the ammeter and voltmeter. Invaluable when it is necessary to test both dry and storage batteries.

Trescot Battery Meter

The only practical vest pocket battery tester.

It serves the same purpose as the Sterling.

Diameter 1 3/4 inches; weight, 2 ounces; depth, 1 1/2 inches.

No. 124. Ammeter 0-40 amperes.

Price.....\$1.00

No. 134. Voltmeter 0-10 volts.

Price.....\$1.25

No. 144. Volt ammeter 0-40 volts, 0-10 amperes.

Price.....\$1.50

Heat-ometer

Attached to radiator cap it tells instantly of a dangerously overheated condition of the motor, lack of water, poor oil or water circulation. Broken fan belt or other conditions causing the motor to overheat are instantly revealed.

A large central tube of specially prepared glass contains a fluid which is normally pink in color, but changes to a deep purple when the motor temperature becomes dangerous.

When the temperature becomes normal it resumes its pink hue. This power of change is everlasting.

All enclosed in a solid metal frame handsomely nickel-plated and very ornamental.

Standard size, 3 3/4 x 5 inches.

Price each.....\$3.80

Junior size, 3 1/2 x 4 1/2 inches.

Price each.....\$2.00

Boyce Motometer

Mounted on the radiator cap. The temperature of the radiator is plainly visible from the driver's seat. It prevents damage to motor from overheating.

Tells instantly if water is needed, if lubrication is poor, if the fan belt breaks, etc.

Standard Model
No. 67050. Finished in beautiful black enamel with brass or nickel trimming. Glass crystals on both sides.

Price.....\$10.00

Junior Model

No. 68050. Black dial with nickel or brass finish.

Price.....\$5.00

Ford Special

No. 69050. Same as Junior, but including handsome special radiator cap.

Price.....\$2.50

Official Gasoline Gauge for Fords

Simply remove filler cap and replace with gauge. You can tell at a glance just how much gasoline you have by raising corner of cushion.

It consists of a float fitted to a spiral upright which indicates contents by a needle on an easily read white enamel dial.

Nothing to get out of order, durable accurate. Made with round or hexagon tubing.
Price.....\$1.00

The Goodrich Tire Caliper

No uniform inflation pressure is practicable. It is agreed that a tire must be inflated for load it carries.

This caliper measures a tire for the actual load. It is scientifically correct and accurate.

Price.....\$1.00

Automobile Necessities

Howe Spot Lights

"The Lamp with the Wonderful Bracket"

Throws a powerful beam of light where it is most needed. Invaluable for country roads at night. Clamps firmly on windshield within easy reach of driver. Can be tilted to any angle desired, to read road signs, street numbers, etc. The light can be thrown down, directly in front of the car, stopping all glare or dazzle—prevents accidents due to insufficient light, and allows cars to pass one another with perfect safety.

It is adjusted on coil springs to give an even, never varying

tension, which holds the lamp firmly in place, yet allows it to be easily turned in all directions. Can be turned on both joints at the same time. Cannot become locked in one direction. Concealed wire is contained in the bracket, preventing worn and broken wiring, besides keeping the wire out of the way. Fastened to windshield by two-piece clamp, making it possible to remove the light by simply unscrewing a wing nut. This enables one to use it for a trouble lamp anywhere around the car. Nitrogen burner, giving a powerful white light. Front diameter, over all, 7½ inches. 6 volt, 21 candle power.

Price each, without mirror.....

\$7.50

Price each, with 4-inch mirror for rear view.....

Electric Heater For Automobile Engines and Radiators

A Warm Automobile in a Cold Garage

Invaluable in unheated garages. Why run the risk of a frozen radiator and burst pipes? Why take the trouble to drain the water out of the radiator every night? Why spend half an hour starting a cold engine?

None of these inconveniences need be borne after this little electric heater is installed. It is not necessary to have a steam heating system for the entire garage when all that is necessary is just the right amount of heat in just the right place—under the hood. It costs less than one cent an hour to keep this heater running. Simply attach heater to your electric light socket. It keeps up a powerful, uniform heat as long as desired.

Price each..... \$3.50

Automobile Bumpers

Flexible Spring
Bumper No. 2

Extremely strong, maximum spring resistance, easy to adjust, Universal fittings. The most satisfactory bumper made. The steel spring arms extend forward, and outward, forming a complete curve from the frame of the car to the front bar. These are so

formed and placed as to provide a maximum of resistance and elasticity.

The front spring bar has three leaves in the center with single leaf at ends. This feature in combination with the curved arms provides the highest obtainable degree of spring resistance. This bumper will fit on the rear of the following cars when only one spare tire is carried: Hudson, Haynes, Cole, Chandler, Mercer and Allen 1916 and 1917 models.

No. S30. All black enamel. Price each \$10.50

No. S40. Black arms and end leaves. Nickel center leaves of front bar. Price each 12.50

Ford Car Bumper

This bumper can be attached to any type of Ford car in twenty minutes, without drilling any holes in any part of the car. It clamps to the front in a secure manner, and will not rattle.

With Channel Bar

F3330. Black (all black enamel) \$7.50

F3340. Black and nickel (black arms and nickeled bar) \$9.00

With 1 1/4-Inch Round Bar

F3350. Black (all black enamel) \$6.00

F3360. Black and nickel (black fittings and nickeled bar) \$7.50

Rear End Channel-Bar Bumper

Reinforced Channel Bar Bumper

The channel bar is reinforced with a piece of T-shaped steel riveted on the inside. Have the same attachments as the "T" bar bumper.

No. R 80. All black enamel finish. Price each \$10.00

No. R 90. Nickel bar, black fittings. Price each \$12.00

No. R110. All nickel plated finish. Price each 17.00

No. K70. All black enamel. Price each \$6.50

No. K80. Black fittings, nickeled bar. Price each \$7.50

Bumpers

**"T" Bar Bumper**

Its light appearance makes it very attractive. The "T" form of steel bar makes a very strong bumper.

No. T 40. All black enamel finish. Price each.....\$10.00

No. T 50. Nickel bar, black fittings. Price each.....\$12.00

No. T 70. All nickel plated finish. Price each.....\$17.00

No. C210. Special for Cadillac, nickel bar, black fittings. Price each....\$12.00

2-inch Round Bar Bumper

A massive and fine appearing bumper. The fittings have a coil spring concealed in a barrel, while the plunger that holds the bumper bar works inside the barrel against the coil spring, giving the bumper two inches resistance against the spring.

No. P190. All black enamel finish. Price each.....\$13.00

No. P200. Nickel bar, black fittings. Price each.....\$15.00

No. P210. All nickel plated finish. Price each.....\$17.50

**Rear End Flexible Bumper**

For $\frac{3}{4}$ elliptic spring as shown in cut. Suitable for gas and electric cars.

No. K90. All black enamel. Price each.....\$12.50

No. K100. Black arms, and end of bar, with nickered center leaves of spring bar. Price each...\$15.00

Common Sense Bumper

With $1\frac{1}{4}$ -inch round bar only.

No. C140. All black enamel. Price each.....\$5.00

No. C150. Black enamel fittings and nickered bar. Price each.....\$6.00

**Flexible Spring Bumper No. 1**

No. S-000. All black enamel finish. Price each.....\$10.50

No. S- 10. Nickel bar, black fittings. Price each.....\$12.50

No. S- 20. Nickel (fittings and front bar nickered, the back always black enamel). Price each.....\$17.50

Owing to the great flexibility of the double steel spring this bumper will take all ordinary bumps with no injury to either the car or the bumper. Made of the finest spring steel, hinged at ends and extending back the full length of the bar on inside, making a double steel spring. Arms are one piece "clamp-on" type.

H. Channon Company Chicago

Hastings Stabilizer

For Ford Cars

Unlike higher priced cars, the Ford has no worm and sector steering gear, consequently it is almost as sensitive to a turn of the road wheels as of the steering wheel.

The Ford is so quick on its feet that it may be ditched in an instant if the front wheel should strike an obstruction when the hands are momentarily removed from the steering wheel.

The driver is thus subjected to a constant muscular and mental strain which greatly detracts from his enjoyment.

This stabilizer is a very simple and effective device attached to the front axle and steering rod. It operates on a simple oscillating spring principle. The spring is single acting, working only by compression and expansion. It can be attached in a few minutes by using only a light wrench.

Price.....\$3.75

Clear-O-Scope Auto Wind Shield Cleaner

Clears rain or snow from wind shield.

Simple and easy to operate. Highly effective. Indestructible.

When you want a clear glass, just move it to the right or left and the work is done. No nuts, bolts or screws. Slips on or off any wind shield instantly. Held by spring tension. No rattle.

Price.....\$1.00

Motor Luncheon Case and Table

Made in three styles and sizes, Nos. 3 and 4 being for from 4 to 6 persons and No. 6 for 2 persons.

The No. 4, which is the most popular outfit, consists of three hinged extension food boxes. Removable cover clasped to top of case and resting on food boxes, forming a good-sized table.

When in car or boat the case is held firmly but is easily and quickly removed for use.

It also has spaces for cutlery, dishes, etc., and for three quart thermo bottles, or six quart Mason fruit jars.

The outfit includes six each knives, forks, spoons, enameled cups and plates and paper napkins, one each salt and pepper shaker.

The case is made of seasoned basswood lined and covered with artificial leather. Catches, lock and handle can be washed easily and kept sweet and clean.

Number.....	3	4	6
Price.....	\$25.00	\$15.00	\$7.50

Presteel Crown Fenders

For Ford Cars

"Crown" fenders vastly improve the looks of a Ford car. "Presteel" fenders are artistic and the very best construction. Made of 20 gauge special fender steel. Completely ironed with 16 gauge toe "irons" for fastening, and given three coats of black enamel, baked on. No unsightly rivets, all joints being electrically welded. They have a 3-inch visor, 3/4-inch crown and are 9 inches wide. Designed to extend an extra inch beyond side of wheel.

Price.....\$16.00

Equi—The Ford Light Equalizer

A reactance coil which regulates the current supplied to the lights upon the Ford magneto, causing them to burn up to almost full candle power when car is running at lowest possible speed. At low speed a variable gap in the magnetic circuit of the "Equi" is open and the inductions of the resistance coil are negligible, being united to the ohmic resistance of the wire wound in the coil.

Price.....\$6.00

Pocket Kook Kit

Folding broiler and toaster. Grate pans for boiling, roasting and frying and two drinking cups, nested. 9 1/4 x 4 1/2 x 2 1/4 inches

Price.....\$2.50

Camp Cooking Crates Only

As illustrated above, size 12x24 inches.
Price each.....\$1.00

Dunham Commercial Extension Body for Ford Runabout

This extension body makes a truck of your Ford. Ideal for small loads. Catches on the side for lumber, pipe, ladders, etc. Body may be lengthened up to seven feet for such loads. Tail board swings out and down to permit easy loading and may be held straight out for a further increase of nine inches. The body is made of heavy fourteen

gauge steel, making it equal to carrying any load the car will pull without denting or bending out of shape. Made from one piece of steel. Perfectly finished at the front to the curves of the seat and at the side by having the steel bent over one inch. Finished in black enamel. Height of sides, nine inches.

Without extension	\$32.00
With extension	\$42.00

Lindsay Demountable Rim Wire Wheels

Lighter, stronger, more durable, and better appearing than wooden wheels. By their light weight and easy running qualities they effect a very considerable saving in tire cost. A set of wire wheels will save their cost in a year by the lowered expense in tires alone. Furnished complete with brake drum, balls and hub cap. Can be put on in a few minutes. Spokes are made of heavy drawn steel wire, swaged and threaded to give the nipple the strongest possible grip. Laced and crossed for strength. Rims of high grade, heavy pressed steel. Set

of four wheels, shipping weight, 150 pounds.

Price per set	\$60.00
---------------------	---------

Dunham Wood Commercial Body for Ford Roadster

A body for light delivery work. There is an increasing demand for a body of this kind that sells at a moderate price. Made of hard wood, strongly bound with iron. Tail gate swings under and is hung on heavy hinges that have a single long bolt through both. Furnished in two sizes to meet different requirements.

Size 54x31, price	\$32.00
Size 66x31, price	\$42.00

Firestone Demountable Rims

Firestone demountable rims have been adopted as part of the equipment of nearly every high class automobile now manufactured. Built by tire makers and designed to conserve time and the life of tires. No complicated parts to get out of order—simply loosen the six retaining clamps and the tire comes off. The time saved in this way soon pays for the cost of the rims, besides saving back breaking work and costly delays. Each part of the rim comes in contact with the others at an angle, thus avoiding any possibility of the parts rusting together. The tightened valve sleeve, by keeping the metal spreader on the inside of the casing firmly in place, securely locks the tire in the rim, making it impossible to throw a deflated tire.

Can be used with either clincher or straight side tires.	
Price per set	\$40.00

Piston Rings

Piston rings, in order to be efficient, must be flexible. They must expand or contract to maintain an even pressure against the cylinder wall. If they fail to do this, lack of compression and consequent incomplete combustion of the fuel charge results. In addition to this, the piston rings must prevent the leakage of oil into the combustion chamber, which causes deposits of carbon. "Anti-leak" piston rings are designed especially to fit the walls of the cylinders even after they are worn by long use. They have no unsealed openings or faulty bearings.

This close fitting quality is accomplished by the use of tapered seat (see illustration) which allows the top ring to conform to the shape of the cylinder walls. A full set of these rings installed in any motor will cut down the cost of gasoline and increase the power. Made of a special metal to insure strength and flexibility. Perfect in workmanship and material. Absolutely guaranteed to give satisfaction. Made in all sizes. Sizes 2 1/2 inches diameter by 3 1/4 inches width up to 6 inches diameter by 3 1/2 inches width. Price

\$1.00
Prices for larger sizes upon application.

Use Gripwell Tires—They Grip the Road.

Ford Detachable Freight Carrier

You can haul five hundred pounds on a Ford Roadster without injury to the car.

A substantial, all steel, handy, roomy carrier, which can be attached or taken off a Ford runabout in a few minutes. Does not scratch or mar the body of the car. Carrier folds or collapses into about 33 x 30 x 3 inches. The value of this collapsible feature is readily apparent for storing the carrier when not in use or for convenient, inexpensive shipping. It weighs only 51 pounds.

Used on salesman's cars for carrying samples, by merchants for special deliveries, farmers for supplies, and tourists for luggage.

Costs less than small truck.

Box attached to a Ford runabout and does not limit the use of car to business purposes.

Price each.....\$20.00

Steel Automobile Creeper

The best creeper on the market for repair shops and garages. Substantially built, with reinforced solid steel centre, well riveted and roller bearing castors, leatherette covered head rest, black Japanned. Tested to 400 pounds capacity and will stand the roughest usage. More comfortable and cleaner than a wood creeper. Costs very little more than a wood creeper, to which it is superior in every way. Easily cleaned, practically indestructible; 36½ inches long, 12½ inches wide and 2 inches high. Shipping weight 12 pounds. Price Each.....\$4.00

H-M-Metal Radiator Shield

Protects the motor cooling apparatus from excessive winter cold. Operates directly from dash board by means of a quadrant device extending through radiator shield. The shuttle arrangement of moving panels in the shield permits three distinct phases of motor heat control; 1st, completely open for moderate weather; 2nd, one-half open for long runs in intensely cold weather; 3rd, completely closed for standing or short runs in especially cold weather.

Shield weighs two pounds, is constructed of sheet metal, swaged so that it lays over swaged edge of radiator.

Only a small hole in the dash near the floor board is necessary to install quadrant and shift lever. Can be installed in any radiator in a short time by an untrained mechanic.

Price each.....\$3.50

Brake Lining

Gripwell

Made of the longest and purest Canadian asbestos fibre. The toughest and most durable lining on the market. Saturated with a chemical solution that makes it heat-proof and almost wear-proof.

Fordbestos

Each set contains 3 pieces of lining. No wire. Each piece is 23 in. long. Size $1\frac{1}{2}$ inches by 5-32 in. Split brass rivets furnished with each set.

Price per set.....\$1.20

Fillometer

The fillometer is a combined gasoline tank filler and gauge. It fastens permanently in place under the cushion of a Ford car. Made of high grade cast iron, and finished in black enamel. By means of a partition extending through the body of the fillometer, it forms a separate air duct to release the air from the tank while the latter is being filled. It prevents any vapor from blowing out in spray. The gauge can easily be read from the seat and shows correctly the amount of gasoline in the tank while driving or filling. A great convenience in stormy weather.

Price each, complete.....\$4.50

Ford Fan Belt

"Real live ones that won't die"

Made of the finest quality leather, tanned by a special process in which no minerals or acids used. Well lapped and glued with waterproof glue, giving them their non-breakable and non-slipping features. Impervious to water, heat or oil, and cannot be hardened or cracked by friction.

Price.....\$0.70

Tool Boxes

The strongest and most durable tool box manufactured. Made of the best quality steel. Handsome gun metal finish. Can be fastened to running board and used for a step. Equipped with Yale lock.

Overhead Auto Washer

A necessity in every public or private garage. The most practical device of the kind in use.

Washer is all brass with the exception of piping and ceiling plate. For this reason it will not deteriorate from the constant contact with water as iron does. Will never leak, as it grinds its own seats as it revolves. It does away with having long lengths of hose lying about the garage floor, where it gets in the way and is sure to deteriorate from the effects of the gasoline and oil. Only a short section of hose is required with this washer, and that is clear from the floor.

Washer complete, as shown in illustration, without supply pipe or hose, but with one five foot length of $\frac{3}{4}$ -inch extension pipe, brace, and ceiling flange.....\$13.00
Best grade rubber hose, per foot......28
Adjustable brass nozzle......60

All prices in this catalog are list. Refer to our discount guide.

Channon Auto Tow Lines

"Don't Get Caught
Without One"

One of the most important parts of a touring kit is a tow rope of some kind—without it you can neither tow nor be towed.

Touring trouble should be anticipated—one can never tell when some unsuspected flaw may appear, particularly on new cars, and it is extremely unpleasant to be caught miles from nowhere on a road where few cars pass.

One can usually borrow or buy enough gasoline to get to the next town, but for a breakdown a tow rope is necessary. The investment is but a trifle and our **Steel Tow Line** with the new reel and holder occupies little space in the tool box.

Method of Attachment. Pass one Manila sling around axle of one car and catch one of the rope hooks through the loops. Attach sling and other rope end to the other car and you are ready to tow or be towed.

The tow line can also be used to pull a car out of a hole or ditch by the car's own power. Loop one of the Manila slings around the rim of a rear wheel; attach the rope with a hook and turn the rope once around the hub of the wheel. Fasten the free end of the rope to the nearest tree, pole or strong fence post, start the car, and since the tree or similar anchor will not give, the wheel turns and winding the rope up on its hub pulls the car out of its position.

Showing Tow Line Complete

A small compact unit fitting into any tool box. The rope cannot kink or snarl up.

The Rope Slings

The Reel or Holder

Don't underestimate the value of the holder—a wire tow line is stronger and less bulky than one made of Manila hemp rope—but it has a habit of twisting like a snake and getting tangled up with everything in the tool box. This holder does away with snarling, also kinking of the rope, which is harmful.

The Reel or Holder

The Tow Rope

Twenty-five feet of $\frac{5}{16}$ -inch flexible steel wire cable with hook carefully spliced into each end. We guarantee these splices to never pull out. If they do we will furnish you with a new rope.

The Slings

These are two endless loops made of good strong Manila rope, spliced very carefully—our splices will never pull out. These slings are looped over the axles of both cars, will not damage the paint and give a certain degree of flexibility which helps to take off part of the shock when starting.

The Wire Rope

Prices

No. 3 Auto Tow Line, French style with metal reel and two Manila rope slings. Weight, 6 pounds. Price each.....\$5.00
No. 4 Truck Tow Line. Made like No. 3, but without holder. $\frac{3}{4}$ -inch steel cable 30 feet long and extra flexible. Price each.....\$6.50

Manila Hemp Rope Tow Line

Some prefer a plain tow line of this type which can be wrapped around the wheels and used like a skid chain to pull out of mud. A superior grade of rope with galvanized hooks secured by strong splices.

No. 1. $\frac{1}{2}$ -inch x 30 feet for light cars. Price.....\$2.00
No. 2. $\frac{3}{4}$ -inch x 40 feet for heavy touring cars. Price.....\$4.00

Spring Shock Absorbing Tow Lines

The Spring Takes All Jerk and Jar

The coil compression spring is of $\frac{5}{16}$ -inch round steel, 2-inch diameter, 10 inches long. Fitted with cap and double draw bars. The rope is $1\frac{3}{4}$ inches x 18 feet and is hand spliced into drawbar eye over an iron thimble. The other end of spring is fitted with strong endless sling which is doubled around axle. Adapts itself to any weight of car. Spring is indestructible. Price complete, ready to attach.....\$5.00

Gordon Seat Covers

"Tailored to Fit"

Used On A Thousand
Models of Auto-
mobiles

Presents a smooth, clean surface to the occupants. Protects clothing from streaks and spots. Saves expense of dry cleaner. Prolongs the life of the upholstery. Adds to the appearance of the ma-

chine. Can be brushed clean in a few seconds or washed with soap and water any time it is desirable. Adds to the sale value of a used car. Fits any car perfectly. The trimmings are the best to be had. The cover can be firmly attached to the seat in a few moments, due to our patent glove fasteners. Comes in tan, gray, black and white.

Fire-Proof Dimmer Goggles

No. 20.	Clear	\$1.00
No. 21.	Amber	1.00
No. 2022.	Clear bottom green top	1.50

Micalite

It won't burn

MICALITE has all the properties of celluloid, but will not burn. MICALITE is just as flexible, transparent and durable as celluloid, but is harder to scratch and will not support combustion.

NOTICE ALSO—The two colors are in one piece without seam or pasted joint. The old-fashioned celluloid eyeshields for dimmer purposes are made of two pieces of celluloid, either pasted together right before the line of vision, or of two pieces, one under the other, with four surfaces to scratch, and a place between for dust and dirt.

Two Colors—One Piece—Fire-Proof

ANOTHER POINT. Instead of using a cotton elastic which is certain to become useless in a short time, we use ordinary rubber bands slip-knotted through the end eyelet, and a rubber ring at the end of one band to fasten the goggle about the head. The bands are easily replaceable—any ordinary rubber band slip-knotted through the hole will do.

Optical Shock Absorber

Alwon Motor Glasses

The color glass protects the eyes when facing the sun or a brilliant headlight. Lenses are amber above and clear below, as shown. Each is made in one piece—not in two pieces pasted together right on the line of vision. Polished frames shell color.

No. 745.	Two colors, clear and amber.	Price each	\$2.00
No. 146.	One color, clear, amber or green.	Price each	1.00

Imperial Auto Folding Chair

The frame is made of the very best oval steel and finished in rich black Japan. The seat and back rest are upholstered in black water-proof art leather.

Built for strength and safety as well as convenience and comfort. Designed for an auxiliary seat in automobiles. An ideal seat for the camp, launch and many other places. It is without question the most comfortable seat made, and when folded occupies less space than any other seat.

DIMENSIONS OF CHAIR—Seat 11x12 inches. Back 12½x3½ inches. Height seat 16 inches. Folded, 12½x20x2 inches.

Price each. \$2.00

Radiator and Hood Covers for Ford Cars

These radiator and hood covers are made of heavy duck, felt lined.

They are heavily bound and come supplied with straps and buttons to fasten them properly. They are made so that it is unnecessary to detach them when hood is raised.

Radiator cover	\$2.70
Radiator and Hood Cover	4.70

The Utility Heater

For All Gasoline Cars

Keeps car heated at comfortable temperature in coldest weather without costing a cent for maintenance. The gases from the exhaust, instead of being wasted pass through the heater and escape into the air beneath the car. Simple, or namental and in destructible. Gives off no obnoxious odors or gases. Can not set anything afire. Can be installed in half an hour by drilling two small holes in floor of tonneau and one in the exhaust pipe ahead of the muffler. In ordering, please state outside diameter of exhaust pipe before it enters muffler. Nickel plated.

Utility heater, each	\$15.00
Utility heater for Ford cars, each	10.00

We carry Radiator and Hood Covers for all makes of cars. Prices on application.

Automobile Accessories

Pyrene Fire Extinguisher

DID YOU KNOW that any insurance company in the United States will allow a 15% reduction on automobile fire insurance rates for cars equipped with the Pyrene Fire Extinguisher?

This extinguisher is an effective safeguard against fires in garages and homes as well as on motor cars.

Few people who see an occasional machine consumed by flames realize the great numbers that are burned annually throughout the country, and the amount of loss and inconvenience, not to mention the fatalities. The sight of burning automobiles along the highway is still a common enough sight in spite of the improvements in their construction. None of these fires and the resulting deaths are necessary. The Pyrene Fire Extinguisher can be relied upon to kill the most stubborn blaze, no matter where it is, quickly and efficiently, without harm to engine or car. A few well directed shots from the extinguisher smother the fire instantly.

Don't use sand or water on your burning automobile. Sand hurts the bearings, and it is a well known fact that water merely spreads gasoline flames.

Pyrene Extinguishers are as easily refilled as a kerosene lamp. The liquid cannot deteriorate or freeze and will not hurt clothing. The extinguisher is easily operated and handsomely finished. It may be carried in the special holder on the dashboard.

Automobile and Wagon Jacks Barrett Auto Jacks

The .088 1916 model one-ton jack meets at a very moderate price all utility requirements of motor vehicles, as to capacity and lifting heights.

By means of the quick acting footlift it is instantly set to any height without ratcheting, the entire raise of the lifting rack being reserved for actual lifting.

The base is made of highest grade malleable iron scientifically ribbed and proportioned to give maximum strength.

No. 311 has also a steel worm and bronze worm gear which provides powerful and easy leverage. Instantly set to any axle height and operated by as short or long a stroke as desired. It is automatically reversible, has ample capacity for the heaviest pleasure cars and will last a life time. The best automobile jack made.

No. 088

No. 311

No.	Capacity Tons	Height Inches	Raise Inches	Weight Pounds	List Price
.088	1	11 3/4	6 1/2	8 1/2	\$3.00
311	1 1/2	11	7	14	6.50

Barrett Auto Truck Jacks

The No. 24, 2 1/2-ton Garage and Truck Jack, is furnished as standard equipment with a great many makes of motor trucks. The load is ratcheted up one tooth space at every down stroke of the lever; to lower, push down the small reversing lever. Operating handle is furnished with each jack.

The Nos. 100 and 200 jacks are the same in design and operation but differ in capacity. The leverage is so compounded by gears that the load is lifted with only one-third the effort required with direct leverage. They are highly recommended for constant service in garages and repair shops where less sturdily built jacks soon wear out.

No. 24. Capacity 2 1/2 tons; height 11 1/2 inches; raise 5 1/2 inches; weight with lever, 15 pounds. Price each.....\$6.70

No. 100. Capacity 3 tons; height 10 3/4 inches; raise 5 1/2 inches; weight with lever, 16 pounds. Price each.....\$8.60

No. 200. Capacity 5 tons; height 13 inches; raise 6 3/4 inches; weight with lever, 28 pounds. Price each.....\$11.00

Nos. 100-200

No. 24

No. 36 Simplex Automobile Jacks

Made of malleable iron and painted. A simple, powerful jack intended for light cars, yet a thoroughly practical tool. Capacity 1,000 pounds; height 10 inches; raise 6 1/2 inches; weight 5 pounds; nicely finished. Price.....\$1.25

New Samson Wagon Jack

Illustration shows Nos. 4, 5 and 6 New Samson Jacks. No. 10 is slightly different in design. The lever is attached to a ratchet cog wheel which in turn operates a rack on movable section. It raises or trips with reverse movement, can be lowered notch by notch automatically.

Eureka Automobile Jacks

No. 1. Atlas.—For cars weighing up to 5,000 pounds. Malleable iron, aluminum finish. Quick and positive action. Only five simple working parts. No chance for load to slip or drop. Adjustment 10 1/2 to 18 inches; weight 6 pounds. Price each.....\$1.90

No. 1. Eureka.—For cars weighing up to 4,500 pounds. For quick adjustment pull screw with hand until top strikes load, spin gear into place, operate handle and load is quickly raised. Adjustment 10 to 17 inches; weight 4 1/2 pounds. Price each.....\$1.25

No. 5. Eureka.—For trucks weighing from 5 to 8 tons. Heavy bearings; long leverage; lifts load easily. Simply built with no loose or delicate parts to become deranged. Adjustment 13 to 30 inches; weight 15 pounds. Price each.....\$5.00

Eureka Jr.—For cars weighing up to 3,800 pounds. Malleable iron and steel, aluminum finish. Light, strong and efficient. Solid stud shaft used for side gear and handle. Adjustment 10 to 17 inches; weight 4 pounds. Price each.....\$1.00

The lower bracket will catch 1 1/2 inches from the ground. When standard reaches extreme height it will not drop back on cogs or pull out of frame.

No.	Will raise vehicles weighing	Tons	Weight Pounds	Price Each
No. 4.	Will raise vehicles weighing	2 tons	16	\$4.00
No. 5.	Will raise vehicles weighing	6 tons	25	5.00
No. 6.	Will raise vehicles weighing	8 tons	32	7.00

No. 10.	With drop hook		32	9.00

Nos. 41-2-3 Simplex Automobile Jacks

These jacks are made from drop forged steel and are the only automobile jacks made in this way. All others are malleable iron or pressed steel. Furnished complete with auxiliary detachable shoe as shown in cut.

No. 41. Cap. 1 ton; height 10 ins.; lift 7 ins.; weight 9 1/2 lbs. Price each.....\$3.50

No. 42. Cap. 2 tons; height 11 1/2 ins.; lift 8 1/2 ins.; weight 11 lbs. Price each.....\$4.25

No. 43. Cap. 3 tons; height 13 ins.; lift 10 ins.; weight 13 lbs. Price each.....\$5.00

Tire Saving Jack

These jacks relieve the weight of the car from its tires and keeps them off greasy floors. Made entirely of malleable iron finished in aluminum. Adjusted to any height of wheel instantly, and will raise 2 1/2 inches with one lift. Wt. per set of four, 30 lbs. Price per set of 4 \$7.00

Bullock Bicycles

In presenting Bullock bicycles we have been guided by one object—to secure the maximum of efficiency.

Every component part entering into the assembly of these machines is of the highest quality procurable for the purpose. No attempt has been made to cheapen them in any way by substituting inferior materials. When we advertise "None Better Made," we mean just that. We do not sell competitive or even second grade machines, and therefore when buying a Bullock bicycle—whether a Roadster model or a Motorbike, you have the satisfaction of knowing that you are securing an article of quality—the best.

Roadster Model

Gripwell Triangle Non-Skid
Bicycle Tires

In offering our customers Gripwell bicycle tires, we are confident that they are the best tire value the market affords. They are strictly first quality and guaranteed. Our economical methods of merchandising enables us to sell them at a very moderate price.

These tires are constructed of the best quality of motorcycle fabric, with a red rubber tread, especially compounded to make them oilproof and reduce punctures to a minimum. The Triangle Non-Skid is our exclusive design and is a positive non-skid tire on wet streets and slippery roads. It possesses a vast amount of tractive power on any kind of roads or streets.

These tires are guaranteed first quality and to give entire satisfaction. Any tire that fails through defective material or workmanship will be replaced free of charge.

Price per pair \$10.00

Columbia Gas Lamp

This gas lamp has a perfect record.

It operates the same as an ordinary barn lantern. It lights, and turns down or out at once.

Nickel plated over brass, powerful double convex lens, improved fish tail type removable burner, gas valve for regulating flame, or turning out entirely. Patent water distributor allows carbide charge to be used repeatedly until exhausted. Self-cleaning water valve; parabolic reflector, combination bracket that fits head or fork; no wicks, no rolled threads to stick; no flimsy material. Diameter of face, 2 3/4 inches.

Price each \$5.50

The Union Sanitary Clothes Hanger

For Mines, Steel Mills, Factories, Etc.

A simple, sanitary and inexpensive clothes hanger, which fully complies with the laws of Illinois and other states which require industrial plants of all kinds to provide suitable and sanitary wash rooms for employees. So arranged that they may change their clothing and provided with lockers or hangers in which clothing may be kept.

In mine, foundry and steel mill work the laborer's clothes after working one shift are usually damp, sweaty, smelly and dirty. When these clothes are stuffed into the very small locker space usually provided the condition of the clothes, also the locker, are hardly "sanitary" as provided by law. The clothes will be found to be in even worse condition than when they were taken off.

The Union hanger elevates the clothing, lunch box and valuables to a point near the ceiling where the circulating of the air rapidly dries the clothing besides keeping out all vermin and protecting such valuables as may be kept in the wire basket. This hanger is sanitary, complies with the law and is appreciated by the worker.

Can be furnished with or without padlock or wire basket as desired. Further particulars upon request.

The Union clothes hangers, besides being simple and inexpensive to install, are sanitary, safe, vermin proof—the location permits of a free circulation of air.

A standard hanger unit consists of: 35 to 40 feet of Union lock link chain with two special chain pulleys, either with lag screw or swivel screw, one special 4-prong ball point hanger and connecting link, two cleats with screws and with or without wire basket or padlock as desired.

Prices per Unit in Lots of 100 Units

Unit No. 132 as outlined above with 35 feet of chain without basket or padlock.....	\$3.60
Unit No. 133 as above with basket but no padlock.....	4.20
Unit No. 134 as above with both wire basket and padlock.....	4.80
Unit No. 135 same as No. 134 but with master key for padlocks.....	4.95

Extra length chain, add \$0.07½ foot.

Steel Paper Balers

Paper in a Baler

Means

Money in Your Pocket

Presteel

With the price of paper soaring, it is easy to start a new revenue by baling waste paper. The baler soon pays for itself many times.

The **Presteel** baler is fireproof, simply constructed and will last a lifetime.

The type of press used gives an enormous amount of leverage, enabling one to get a greater amount of weight into the same cubic space than could possibly be done by other balers.

The open top permits the dumping in of waste paper without poking with the hands from the front. The elastic sides of the bin provide for the easy quick removal of the bale from the front of the baler.

A list of dealers in paper can be had from the local Chamber of Commerce or Board of Trade.

Dimensions and Prices

Lot No.	Size of Press, Inches	Size of Bale, Inches	Weight of Bale, Pounds	Shipping Weight, Pounds	Price
1	19x21x39	17x18x35	125-150	250	\$48.00
2	22x23x45	18x20x38	150-225	325	60.00
3	26x27x56	22x24x42	250-350	425	95.00

No. 3 is equipped with double ram.

Wood Balers

The Superior baler gives bigger value for the money than any other baler on the market. The No. 30 Superior contains over 300 more cubic inches baling space than balers made by some of the other manufacturers listing at 20 per cent more.

The "U" shaped steel clamp encircling the entire baler protects sides and bottom when baling. The cross beam is reinforced by two steel truss rods. The large manganese iron nut with concave top insures perfect lubrication and ease of operation. The 1½ screw is more than ample strength and enables a boy to operate the Superior balers. The bottom and top are double. All corners are bound with heavy sheet steel.

More than four years of continual use without breakage or signs of wear proves perfect construction and good service.

Two automatic spring locks on sides of balers hold compression clamp. Door locks are easily opened and do not project outward and are out of the way.

No.	Size Baler, Inches	Size Bales, Inches	Weight of Bales, Pounds	Price Each
2	48x27x22	18x22x30	150	\$12.50
3	48x34x22	18x27x30	175	13.50
30	48x24x34	20x27x30	225	15.50

All above numbers are three-wire balers which hold the bale better than a two-wire baler.

Bundle of 250 extra wires with one end looped. Price.....\$1.50

Superior

The Newman 1916 Grille Model Watch-Clock

A portable watch clock which must be carried by the watchman on each inspection round.

Approved by the National Board of Fire Underwriters, and all Mutuals.

The movement contained in this clock is similar to that of a fine watch—being jeweled and having thick plates and pillar posts, thus minimizing damage in case of accident. Pinions and pivots are of tool steel, highly polished. Cut wheels. Escape balance and pallet mounted in separate bridge with heavy balance cock.

The keys are of hardened phosphor bronze, which will not rust or corrode, and a metal guard on the flange protects the die from damage when the key is allowed to fall against masonry, iron pillars, etc.

Clock in Pouch

The case is of nickel aluminum, light in weight and durable. A metal guard protects the timepiece from breakage.

A complete outfit consists of a watch, pouch, carrying strap, station keys, chains, seals and one year's supply of paper dials. It also includes lift cover key box as illustrated, but for stations exposed to mischief a locked type of box will be furnished without extra charge.

6 station outfit complete	\$115.00
9 station outfit complete	120.00
12 station outfit complete	125.00
16 station outfit complete	130.00
24 station outfit complete	170.00
35 station outfit complete	205.00

This clock protects The Underwriters Laboratories, Chicago; The Insurance Exchange Building, Chicago; The Underwriters Building, New York, and the Bank of England, London, and it can protect you.

Key in Box

Alert Clock

Hardinge Watchmen's Portable Clocks

Approved and labeled by the National Board of Fire Underwriters and by all factory Mutuals.

The only American made portable watchman's clock.

The design and workmanship of the Hardinge clock movements are in accordance with the most stringent requirements for accuracy and endurance. These movements have eleven-jewel escapements which assure correct time-keeping. The plates are extra heavy and the pinions are hardened and finished like in a watch. In fact the only difference between this movement and a high grade watch is in size and strength.

The movement is entirely separate from the recording device, is absolutely dust proof. The jewels are protected from jars by a spring device and all parts are interchangeable.

The Hardinge Alert and Patrol Systems of portable clocks possess several exclusive and advantageous features described in a special booklet mailed on request.

The Alert System, for service requiring only a limited number of call boxes, has a capacity of 32 stations. It is only necessary to order the actual number of stations required as others may be added at regular price per station, with no rearrangement or interruption of service.

Complete with leather pouch, wire grill and a supply of paper dials to last one year.

Price.....\$66.00

Locked stations for exposed points. Price each.....3.30

Station for interior points not exposed. Price each.....2.20

The Patrol System, an unlimited clock system for plants requiring many stations and employing two or more watchmen.

Complete with leather pouch, wire grill and a supply of paper dials to last one year.

Price.....\$60.00

Patrol stations all lock boxes opened by master key. Price each.....6.00

There is no limit to the number of stations used with one clock and the system may be expanded or contracted at will.

Alert Drop-Cover Station Model "B"

Grinding Mills

For Grinding Corn, Cobs, Husks and All Kinds of Small Grain

These machines are designed for general all-around grinding and are equipped with a set of double shear grinders or burrs which gives them a grinding surface of just double that of any other mill of equal size. Consequently they do twice as much work.

This type of grinder far excels any other for grinding corn with or without husks, cotton seed, Kaffir heads, peas with vines, sheaf oats, clover or alfalfa, etc.

Material to be ground passes first through the hopper to spiral knives, which revolve towards each other, and cut or crush it by a shearing process, which is adjustable. When this operation is completed, material drops to the lower crusher, which acts as a force feed, forcing the mass into the burrs.

Grinding into meal by the burrs is the final process, which may be fine, medium or coarse, but is always uniform.

Steel Wire Cloth

In ordering wire cloth always specify mesh, size wire, width and quantity desired. Mesh is the number of openings per lineal inch, center to center of wires. Space is the actual openings between wires. Washburn and Moen Gauge has been adopted as standard for steel wire cloth; Old English Gauge for brass and copper wire cloth. Full rolls contain 100 lineal feet. Cut rolls cannot be returned for credit or exchange.

Diagram Showing Gauges of Wire and Thickness in Inches

Section Cut through Weld

Pittsburgh Perfect Wire Fencing

Perfect Weld—Double Galvanized

While this fence is called "double galvanized," it is, in reality, three times more durable than the galvanizing in ordinary fencing. The wire remains in the pure zinc bath three times longer than in the process usually used, allowing the spelter to penetrate deeply into the fibre and at the same time leaving a heavy, even layer of pure zinc on the surface.

The weld makes a perfect union of the two wires at every joint. To make this perfectly clear, we illustrate a weld cut through the middle. Note the perfect amalgamation. There is no seam. The surface galvanizing is piled around the joint. The weld is twice as strong as the wire itself, because at each joint there are two wires merged into one. It is practically one solid piece of perforated metal. The wires are not cut into small pieces, twisted, jammed or hammered to the ruin of the galvanizing, nor is it burdened with useless wire which contributes weight at the expense of strength.

All "Pittsburgh Perfect" Fences have stay wires as heavy as intermediate line wires. A fence is only as strong as its lightest wire.

No wire projections to injure cattle or pull wool from sheep.

Stays cannot be slipped or separated from strands.

Adjustable to uneven ground.

Pittsburgh Special No. 9 Ornamental Lawn Fence

With Double Scroll

Cut shows fence 48 inches high, 9 bars, all heights, No. 9 wire. Upper pickets spaced $2\frac{3}{4}$ inches apart, lower pickets $1\frac{3}{8}$ inches apart.

Styles of General Farm Fence listed here are made with stays 9 inches apart (Regular Wt. only).

SPECIAL HOG FENCES

Plain top, also made with ornamental top as below.

Drive Gate Ornamental Top, also made with plain top as above.

Pittsburgh Perfect Gates

The tubular frames used in all "Pittsburgh Perfect" Gates have electrically welded joints, which produce one-piece, continuous frames of greatest strength, rigidity and durability. Couplings, which necessarily weaken the frame, are eliminated. The weld is equally as strong as the tubing itself.

When ordering, specify whether Ornamental Top or Plain Top is desired. Unless otherwise ordered, all Drive will be covered with "Jumbo" (all No. 9 wire) Farm Fence, stays 6 inches apart.

For Drive Gates covered with Lawn Fence, Plain or Ornamental Top, add \$1.00 to net price. We cannot cover with Lawn Fence gates over 50 inches high.

Single Drive Gates made only in heights and widths enumerated below.

Set posts 6 inches farther apart than width of gate.

Gates furnished complete with latches and hinges for wooden posts. 34-inch and 42-inch gates have single latches. 50-inch and 58-inch gates have single-action double latches (see cut).

Widths 12 inches, 18 inches, 24 inches, 30 inches, 36 inches, 42 inches, 48 inches, 54 inches, 60 inches and 72 inches. Netting galvanized before weaving shipped unless otherwise ordered.

Excelsior Poultry and Rabbit Fence

All wires are specially cold drawn from hard steel stock, exceptionally strong and thoroughly galvanized to prevent rusting.

This fence is made light and heavy weight. The light has 19 gauge body wires and double 19 gauge selvage. The heavy has 17 gauge body and single 14 gauge selvage wires top and bottom. Made in 10-rod rolls.

List Price Light Grade

Mesher.—The 1st, 2d, 3d and 4th spaces from bottom are 1½ inches. The 5th and 6th spaces are 1½ inches. The 7th and 8th spaces are 2 inches. The 9th and 10th spaces are 2½ inches and the 11th and 12th spaces are 3½ inches.

These meshes make up exactly the first 24 inches in height. All meshes above are 4 inches and the spacing of all uprights or stays is 4 inches.

"Veribest" Stretcher

The simplest, cheapest, strongest and the only satisfactory tool ever gotten out. It distributes the pull over the entire area of the fencing and stretches the whole width of the fencing at one time until the tension is right and the fencing is taut.

We especially recommend this stretcher for stretching "Pittsburgh Perfect" fencing, although it will work equally as well for stretching other makes. We do not ship wood handle with the stretcher. A hard-wood stick five to seven feet long will answer the purpose fully.

Price each, without handle. \$6.00

When ordering parts for stretcher, specify same by number. Write for discount.

Lawn Mowers, Clippers and Rollers

"Channon Special"

Ten-Inch Wheels—Four Blades

The material from which this machine is built is of the very best, the reel knives being made of manganese steel and the cutter bar of crucible tool steel. This is the same material as used in higher grade machines, Helmer and Boughton. The cold rolled steel shaft passing through the center of the open wheel mowers makes them rigid and permits their use as an axle. This makes an absolutely substantial axle. The long hub on the open wheel mowers aids the wheels to run easy and true, lengthens the life of the machine and reduces the wear on the ratchet. The cutter bar blade is fastened to the reel by set screws at each end and, being of extra length, makes them accessible for quick adjustment. Furnished in three convenient sizes, 16, 18 and 20-inch diameter.

Width of blade, inches.....	16	18	20
Shipping weight, pounds.....	45	47	50
Price each.....	\$8.20	\$9.20	\$10.20

Helmer Lawn Mower

Ten-Inch Wheels—Four Blades

The "Helmer" is so built that it is one of the most pleasing to operate. Its pleasing design, proportion of weight, size of reel and reel blades make it a favorite as an all around machine. The wheels are fitted with solid hubs and oil retaining chamber, and are held by a steel clip bolted to the casing and fitted over the inside end of the hub, which is enlarged for the purpose. This permits the oil to circulate freely around the axle. No cotter pins or washers are necessary to hold the wheel on. The ratchets used are about one-fourth larger in diameter than the average. The shoulder on which the ratchet pins catch are longer, allowing a larger holding surface and more metal for them to wear on.

Width of blade, inches.....	16	18	20
Shipping weight, pounds.....	54	60	64
Price each.....	\$12.00	\$13.00	\$14.00

Boughton Ball-Bearing Lawn Mower

Eleven-Inch Wheels—Five Blades

To satisfy the demand for a strictly high grade machine, we offer the "Boughton." Its noiseless, light-running operation cannot be excelled. Two reel blades are on the cutter bar blade at all times, giving a short cut. The reel is adjusted to the center bar blade and is the most accurate form of adjustment yet designed. It is easily set, then locked by a simple locking device, which preserves at all times the rigidity and correct alignment of the machine. A special feature of the Boughton machine is the turned-up hardened lip on the crucible tool steel bar blade. This turned-up lip feature makes the cutter bar blade self-sharpening and gives a larger wearing surface. The reel is 5 1/2 inches in diameter with five blades of manganese steel. The balls, cups and cones are of the highest grade steel, uniformly hardened and dustproof. Furnished in three sizes, 16, 18 and 20-inch diameter.

Width of blade, inches.....	16	18	20
Shipping weight, pounds.....	65	68	70
Price each.....	\$17.00	\$18.00	\$19.00

The Victor

Grass Clipper

A very handy device for trimming lawns in narrow spaces, along walks and drives around trees and shrubbery and on banks or terraces. It dispenses with the old method of trimming with grass shears. It is very simple in its operation and is a very quick cutter. No need of back-aches when this cutter can be used from a standing position. Diameter of wheel 5 1/2 in. 5 1/2 in. cutting capacity.

Price each
\$5.00

Water-Weight Lawn Rollers

For use on lawns, gardens, tennis courts, athletic fields, golf courses, walks and drives. Its very easy running quality is due to the use of roller-bearings, high carbon steel, perfectly round and smooth axles—as used in automobile construction. The axle revolves freely in the roller-bearings at each end. The rolls revolve independently, being loose on the axle. The handles are strong and rigid, but light—all steel except the grip. Two weights are attached to the handle on either side, keeping the handle off the ground at all times. The weights are hung on the outside of the roll ends, instead of the inside where they work loose and cannot be readily reached. The edges are rounding to avoid cutting.

We can also furnish rollers without handle weights or without the water-weight attachment in most any size desired. Information gladly furnished.

5	18 to 24, inclusive	22	13.00

The American Wolf Type Miner's Safety Lamp

An American Made Lamp Similar to the Imported Wolf Safety Lamp

Its construction has proven the most satisfactory. It is made of heavy cold rolled steel tinned with brass trimmings. It is stronger, more serviceable and costs less to maintain than any other safety lamp on the market.

It is very sensitive to gas, indicating plainly as low as $\frac{3}{4}$ of 1 per cent with the luminous flame, and is extensively used for testing purposes. With a non-luminous flame, as low as $\frac{1}{2}$ of 1 per cent of gas may be detected and $\frac{3}{4}$ of 1 per cent shows a distinct gas cap.

It has from 1 to $1\frac{1}{2}$ c. p. illuminating power and the light remains practically constant from 9 to 12 hours.

The maintenance cost is very low and should not exceed 1 cent each lamp per shift, for naphtha, repair parts and supplies. The fuel burns as a gas. The wick does not char and rarely requires renewal.

The standard lamp for general use! Burns naphtha and is fitted with double gauzes, pyro metal or match tape internal igniter, key or magnetic lock, and burner for either flat or round wick.

The shield, or bonnet, is corrugated to increase the radiating surface, and the perforations are so made as to prevent the high velocity currents from impinging directly against the gauze. A plain steel bonnet can be furnished, but it has less radiating surface and does not keep the lamp as cool.

The gauzes are of the best grade charcoal iron wire carefully woven. Brass or copper wire can be furnished at small additional cost.

It has passed the most exacting tests and been formally approved in practically every mining locality. It has been tested in high velocity currents up to 2500 feet per minute.

Price each, as described above..... \$4.50

The American Pneumatic, Signal System

A thoroughly reliable pneumatic signal system, durable, easy to install, and which will not echo, nor repeat the signal given. It is positively the only pneumatic signal device which will operate without an echo, an inestimable advantage, as all confusion from this cause is avoided.

It consists essentially of a specially designed air pump which when operated at any station on the line compresses the air sufficiently to cause the desired signal to be given simultaneously at all stations on the line. One blast of the whistle or one stroke of the gong is given for each impulse of the pump piston.

The signal pump is entirely self-contained and no fittings are required for its erection. All that is necessary is to erect a suitable pipe line connecting the points between which it is necessary to signal, and attach the pumps. One pump for each station.

Line Can Be Used as Speaking Tube

The piston rod is hollow and upon opening the check valve near the mouthpiece the line is open as a speaking tube. Sound is transmitted sharp and clear in the very deepest shafts. This feature is invaluable when the mine telephone is out of order, or if an accident should occur and more than one method of communication is desired.

Once properly installed there is practically no maintenance expense. The pump is heavily constructed of cast and drawn brass and has no delicate parts. Signals installed for 10 to 20 years still give perfect service, the only expense being an occasional new packing ring.

It cannot get out of order. Left untouched for an indefinite period it will operate perfectly at first impulse of the piston.

Materials falling down shaft cannot cause a false signal, as frequently occurs where mechanical signals using wires are employed. There are no wires to break or short circuit and the signal line is not readily damaged by fire or water.

Prices

100-pound drums. Price per drum	6.00

The "Buckeye" Kerosene Light

Fig. 2255

A portable light for outside work. Very popular with railroads and contractors, chiefly on account of its simplicity and because it uses kerosene which is cheap and readily obtainable in the smallest hamlet in the country.

Unaffected by wind or rain. Casts no strong shadows. Has no mantles to break as in a gasoline light. It is a portable light torch, having the power within itself generated from kerosene oil forced by compressed air to a burner which is heated by a simple process before the oil is turned on. When turned on, it at once becomes vaporized and sends forth a strong, white, smokeless flame 12 to 40 inches long, depending upon the size of the lamp. Uses common or stove kerosene.

This is the light that was adopted as standard by the Panama Canal Commission.

Fig. 2255

Size No.	Price Each	Candle Power	Size of Tank, Inches	Oil Consumed per Hour	Weight, Boxed	Extra Burners
No. 3	\$65.00	2000	16x22	1 1/4 Gal.	160 Lbs.	\$15.00
No. 5	75.00	4000	18x30	1 3/4 Gal.	210 Lbs.	22.40

The "Buckeye" Carbide Light

A flare light that will stand wind, rain or storm and operates at a cost of about one cent per 1000 candle power.

The simplest form of mechanism possible, no pumps or any moving parts, no mantles, no heating of burners, can be started very quickly and requires no attention until burned out.

The action is caused by water attacking the calcium carbide and generating acetylene gas, which is the nearest approach to artificial sunlight.

Carbide can be purchased in some localities as low as 3 1/2c lb.

* Freezing—During the generation of gas, a large amount of heat is liberated (as in slacking lime) this would prevent any danger from freezing, but in extreme latitudes the addition of calcium or chloride will prevent all freezing.

Recharging—By the use of extra cylinders the capacity in length of hours can be carried on continuously.

Size No. 5, Type S.

Tripod Attachment can be applied to any light, giving double the light but for shorter periods. Outfit consists of tripod, reflector, burner, unions, valves, 25 feet of hose and connections to attach to standpipe on standard light.

Price.....\$40.00

Cylinders—The capacity of one cylinder is 10 hours; with extra cylinder 20 hours. An extra cylinder with carbide cage is usually purchased and recommended.

Type "S" Outfit—For wrecking cranes, dredges and steam shovels. Generator is placed on the machine and piped to the reflectors which may be located where desired. This outfit includes the generator, 25 feet of armored hose, reflector, burner, unions, cocks and all connections.

The "K-B" Portable Gasoline Light

An 800 Candle Power Outdoor Lamp

A small portable light, a general favorite with contractors, railroads, mining and lumber camps, farmers, circuses, tent shows, camping parties and other places where a light that will stand rough usage is required. It is a complete plant in itself, and can be hung anywhere; burns well inside or outside. Absolutely storm proof; is easily lighted and cleaned; is equipped with a self guiding cleaning needle, which can also be used as a regulator. The tank is made of heavy galvanized sheet steel, and has a gasoline capacity of one and one-half gallons and can be operated at a cost of about one cent for two hours.

Weight 12 lbs. Price each.....\$15.00

Kerosene Lanterns

**Cold Blast**

No. 2 Cold Blast for use indoors or out. Gives a steady, white light.

With White Globes

Per dozen . . . \$10.50

With Ruby Globe

**No. 20 Tin Tubular Cold
Blast Searchlight**

Japanned finish; throws brilliant and steady light; will burn out of doors as well as inside without smoking or flickering; it is not affected by wind or strong drafts; has 7-inch nickel plated brass reflector with 16-inch concentric corrugated hood. They are useful wherever a strong reflected light is required. They may be filled, lighted and regulated without removing the globe. Has a No. 2 cold blast burner; 1-inch wick; cold blast globe and fount holds 1 1/4 quarts of oil; burns 48 hours.

Price each . . . \$3.00

Kerosene Lanterns

"Little Star" Lantern

The "Little Star" is a favorite among lantern users. It gives a 3 C. P. light, is only 11 inches high and will burn for 12 hours straight. Patent tinned steel No. 1 burner and $\frac{5}{8}$ -inch wick. Has positive-locking globe lift and dome shaped solderless oil fount. Price per dozen \$6.00

Globes

Price per dozen \$1.50

"Junior" Cold Blast Lantern

This little lantern is one of our best selling small lanterns. Used mostly around barns and on milk wagons. It stands 12 inches high, gives a 6 C. P. light and will burn for 13 hours with one filling. It has all the latest improvements; globe lift inside of frame; safety wing-lock No. 1 burner; dome-shaped solderless oil fount; $\frac{5}{8}$ -inch wick. Weight 2 $\frac{1}{2}$ pounds. Price per dozen \$8.50

Globes

Price per dozen \$1.50

"Buckeye" Dash Lamp

Black enameled dash lamp. Burns steadily, even in the strongest wind. It has a dash clip-spring, a ball for use as a hand lantern and also serves as a wall lamp. Bright corrugated tin reflector and a 2 $\frac{1}{4}$ -inch magnifying bull's eye lens in front of flame. Has a safety wing-lock No. 1 burner; positive locking globe lift; dome shaped solderless oil fount; safety well and large oil filler. 13 $\frac{1}{4}$ inches high, $\frac{5}{8}$ -inch wick and burns 19 hours. Gives a bright 10 C. P. light. Weight 2 pounds. Price per dozen \$10.50

Globes

Price per dozen \$1.50

"Junior" Wagon Lamp

Designed to meet the requirements of the state and city laws regulating night lights on horse drawn vehicles. It has a clip-spring holder in addition to the combination socket taking a round or flat bracket. It lights the road and shows a red danger signal to the rear. Has a bright corrugated tin reflector and 2 $\frac{1}{4}$ -inch magnifying bull's eye lens in front of flame; also a 2 $\frac{1}{4}$ -inch ruby rear lens. 12 inches high; 10 C. P. light; $\frac{5}{8}$ -inch wick; burns 13 hours and weighs 2 pounds. Price per dozen \$15.00

Globes

Price per dozen \$1.50

"Eureka" Driving Lamp

A reliable lamp for night driving for those who like a small but bright light. 7 $\frac{1}{4}$ inches high. Made of cold rolled steel. Has a 3-inch door lens. 2 $\frac{1}{4}$ ruby rear lens and burns for 10 hours.

Price per dozen \$18.00

"Imperial" Platform Lamp

Burns steadily with a clear white flame, giving 100 C. P. reflected light. 21 inches high, 10 $\frac{1}{2}$ inches wide, 10 $\frac{1}{4}$ inches deep, 8-inch reflector, 1 $\frac{1}{2}$ -inch wick. Burns 17 hours. Weight 21 pounds. Price each \$7.50

"Climax" Platform Lamp

For both indoor and outdoor use, dancing platform, skating ponds, etc. Two sizes, No. 1, 15 inches high, No. 2, 17 $\frac{1}{2}$ inches high. Easy to substitute gas pipe and burner.

Boughton Brand Paint

All paints under our Boughton brand can be relied upon to give not only the utmost covering capacity, but to contain the finest ingredients, thoroughly and properly ground and mixed.

A painting job consists so largely of labor that it is poor economy not to buy good paint.

Poor paint costs just as much to put on as good paint. Good paint stays on longer and its protecting and preserving qualities are in direct proportion; in other words, a coat of good paint will protect for a long time, while a coat of poor paint, although it may look bright and fresh for a time, soon loses its protecting qualities.

Under the Boughton label there is a paint for machinery; a paint for your engine, boiler, boiler front, smokestack; paint for concrete and brick structures, cement floors, mill and factory interior walls and ceilings, barns and roofs, wagons and implements; a paint for painting interior and exterior of houses; in fact, a paint for every purpose.

Boughton Cold Water Paint

The perfect paint for machine coating large surfaces.
Easier to prepare than whitewash—costs but little more.

Sanitary, Fire-Retardant, Light-Reflecting

It is a finely ground pigment prepared for cold water mixing and produces a sanitary paint, possessing fire-resisting qualities recognized by the National Board of Fire Underwriters. It contains no lime, alkali, injurious chemicals, or ill-smelling animal matter and will not burn the hands and face or harm the clothing of the workman, as does whitewash. May be applied with brush or paint sprayer.

It cannot be equalled for coating the interior walls and ceilings of mills, factories, warehouses or similar structures. Can be applied to either smooth or rough surfaces of wood, cement, stone, brick, metal, or plaster, forming a beautiful finish, which will not fade, turn yellow, chalk or peel. The white is a pure white, and will stay white. It makes the most unsanitary dark, grimy, and unpleasant places clean, bright and cheerful. Does not scum, foam, or settle when used with a spraying machine, and will remain in perfect solution without clogging the machine.

Its cost is one-tenth that of oil paint, and it is ten times as good as whitewash.

Sprays freely, and much more surface can be covered and more satisfactorily, than with any other paint on the market.

Five pounds, mixed with water, will make one gallon of paint, and cover on most surfaces about 300 square feet.

Style J Spraying Machine

A strong, durable and efficient sprayer used in applying Boughton cold water paint. The working parts are brass, the handle and legs are of iron, bolted firmly. It has a suction hose to extend into bucket or tub, or it may be adjusted to a barrel.

Price each, complete with 10 feet of discharge hose and long spray rod.....\$22.00

Style J Spraying Machine

Boughton Mill White

A Bright Intense White Paint for Lightening Up Factory Interiors

Boughton Mill White is the only oil paint (without varnish) giving a glossy tile-like finish. Do not mistake it for a kalsomine or cold water paint. It is a combination of a paint and an enamel possessing the easy working qualities of a linseed oil paint. It is as white as porcelain—and stays white—and has a high gloss finish like tile or enamel. It flows easily from the brush and dries hard and white. Keeping it clean and sanitary is a simple matter. It can be washed with soap and water as easily as tile and does not require frequent renewals like a cold water paint and will not powder or scale off. It is an ideal wall coating for the inside of all buildings, such as packing houses, dairies, creameries, bakeries, breweries, laundries, garages, machine shops, mills, factories, etc. Improves the lighting in any shop, and the workmen can accomplish more and better results from their day's work. The high gloss will not absorb light or coal dirt, germs or odors like a flat paint, but utilizes all the available light by reflecting it down upon the machinery and in every corner, reducing the light bills and lengthening the daylight day.

Two coats are equal to three coats of lead and oil.

Approximate covering capacity, 250 square feet to the gallon, two coats.

Boughton Mill White Primer

Boughton Mill White primer is used on metal ceilings, brick, plaster, concrete and other porous surfaces. We recommend our Boughton primer as a coating preparatory to using the Mill White, on account of its special adhering quality to these particular surfaces, and at the same time giving a non-absorbent foundation for the finishing coat of Boughton Mill White.

Boughton Cement and Brick Coating

A Waterproof, Dustproof, Wearproof Coating for Cement, Concrete or Brick Floors, Walls or Ceilings

By driving into the pores of new concrete and brick structures, Boughton Cement and Brick Coating forms a part of the surface, resisting the dampness and producing a splendid flat finish. Used for all inside and outside brick, stone, cement, concrete, stucco, old and new plaster. Prevents wearing and dusting of cement surfaces, particularly floors of warehouses, factories, vaults, basements, etc. Can be used on floors of garages and engine rooms as well as walls. Its hard flint-like surface is very easily cleaned and proves unequalled as an aid to maintaining a dry and sanitary building.

Its covering capacity is about 200 to 400 square feet, according to the finish and condition of surface. Write for color card.

Barrels and half-barrels, per gallon.....	\$4.00

Boughton Cement and Brick Coating Reducer

Used in connection with our Cement and Brick Coating in thinning or reducing to the proper consistency for the particular porosity of the floor. Thin coats are especially important in treating cement floors. Two thin coats will produce far more satisfactory and permanent results than one heavy coat. On account of the different materials used and the different methods employed in hardening the cement, no two floors are alike in porosity.

Boughton Graphite Paint

Liquid Form

Graphite in its liquid form is used for painting smoke-stacks, iron structures, roofs, bridges, boilers or any metal or wooden surface where the exposure is severe and it is necessary to have a durable non-corrosive paint.

Graphite is practically indestructible and preserves iron and steel surfaces for an indefinite length of time. For that reason it is being used more and more each year. The graphite used in the manufacture of this paint is a natural product and is absolutely pure. It possesses fire-proof qualities and will resist the action of alkalis, acids, gases, water, brine, and sulphur fumes. On account of its elasticity it will successfully withstand the heat and cold.

One gallon of Boughton Graphite Paint will cover 500 to 600 square feet of space, according to the weather and surface. It spreads easily and prevents corrosion if the surface is thoroughly covered.

Made in black, natural, green and brown. Black always furnished unless otherwise specified.

Barrels and one-half barrels. Price per gallon.....	\$3.00
5 and 10 gallon cans. Price per gallon.....	3.30
1 gallon cans. Price per gallon.....	3.50
One-half gallon cans. Price per can.....	1.80

Paste Form

For those who desire to mix their own paint, we can furnish Boughton Graphite Paint in paste form. Painters often mix their own paint in accordance with the condition of the surface. Otherwise it does not differ from the liquid form.

---------------------------------------------	--------	--------------------------------------	--------

Boughton Smoke Stack Paint

This paint, although not as durable and heat resisting as Boughton Graphite Paint, is used extensively for painting smoke stacks, boiler fronts, etc. It will wear an exceptionally long time and protect the metal from deterioration. We recommend it for use on any metal surface.

Made in black only.

Barrels and one-half barrels. Price per gallon.....	\$3.30
5 gallon cans. Price per gallon.....	2.40
1 gallon cans. Price per gallon.....	2.50

Boughton Structural Paint

For application to temporary construction or enclosed structural iron or steel work. There is no better way to preserve structures than to keep them covered with a good coat of paint. It adds considerably to its appearance and at the same time is economical. It dries rapidly and does not become brittle or hard and crack off, but remains tough and elastic. It is a non-porous paint which seals the surface and prevents rust and corrosion. Furnished in two shades—red-oxide and deep brown. Also black.

In barrel lots. Price per gallon.....	\$1.60
---------------------------------------	--------

Boughton Flat Black Paint

Prepared ready for use. Can be used on either metal or wood for producing a dead black, wrought iron finish. For ornamental iron work, picture frames, mouldings, lamps, gas fixtures, etc. One gallon cans. Price per can..... \$4.50
One-half gallon cans. Price per can..... 2.40
One quart cans. Price per can..... 1.20
One pint cans. Price per can..... .70

Boughton Galvanized Iron Primer

For first coat on galvanized iron. Obviates the liability of peeling or scaling so common where ordinary paints are applied direct to the galvanized surface. May be coated over with any good oil or graphite paint. Recommended for use as a first coat on galvanized iron stove fronts, roofs, cornices, etc. Barrels and one-half barrels. Price per gallon..... \$4.80
5 and 10 gallon cans. Price per gallon..... 4.90
1 gallon cans. Price per gallon..... 5.00

Boughton Asphalt Paint

Mostly used for metal exterior work, boiler tanks, or wherever a metal preservative is needed. Owing to its ability to stand heat and cold without cracking or checking, it is most satisfactory for steam pipe coating. It is also recommended for use on all kinds of roofing as it is not in any way affected by water. It is an extremely heavy paint and when it dries it has a brilliant jet black lustre. We carry this paint in stock in two grades only, and unless otherwise specified, No. 1 will be shipped.

Boughton Stove Pipe Enamel

Made of special ingredients to withstand extreme heat. Will prevent rust and always maintains a glossy finish. Mostly used on stove pipes, registers, furnaces, ventilators, gas ranges, grates and all metal surfaces.

Pint cans. Price each.....	\$0.70
Half-pint cans. Price each.....	.60

U. S. G. Co.'s Mexican Graphite Paint

Made from pure air floated Mexican graphite ground in linseed oil. Unaffected by smoke, water, brine, acids, alkali, extreme temperatures, steam, moisture, sulphur fumes or any chemical or climatic condition. Used on structural iron and steel, steam pipe, coils, roofs, smokestacks, boiler fronts, vessels, freight cars, water tanks, bridges, etc. Under ordinary weather conditions covering power per gallon is approximately 1,000 square feet of smooth or new metal surfaces, 750 square feet on rough, scaley or rusty metal surfaces and 400 square feet on dressed lumber or old painted wood.

Dixon's Silica—Graphite Paint

This is the original graphite paint manufactured for fifty-two years in one quality only—four colors. The pigment is crystalline or flake graphite, a silica mined by the Jos. Dixon Crucible Co. The vehicle is pure boiled linseed oil.

It is the best paint for smokestacks, gasholders, boiler fronts, standpipes, fire escapes, iron shutters, fences, bridges, grain elevators, roofs and all metal surfaces. Has given from eight to fourteen years' service on iron and steel—fifteen to twenty years' service on wood.

Spreading capacity, 500 square feet to gallon first coat, 550 square feet to gallon second coat.

Made in four shades.

Use black for stacks, boiler fronts and heated surfaces; red for roofs; green and natural for other iron and steel surfaces.

Barrels (50 gallons).	Price per gallon	\$3.30	5-gallon kegs.	Price per gallon	\$4.30

Boughton Machinery Paint

Gloss and Flat Finish

A guaranteed preservative against absorption of moisture, or rust for painting new or old machinery and metal castings. Made in liquid form and giving a steel appearance. It dries perfectly, leaving an excellent finish, either flat or glossy. Has an unusual amount of elasticity and durability. Furnished in four shades of steel and stock shades of red, blue, green and black or will match any shade submitted. Write for our color sheet.

1 gallon cans.	Price each	\$3.20
3 and 10-gallon cans.	Price per gallon	3.10
Full barrels.	Price per gallon	3.00

Paste Form.—For those who mix the paint themselves, Boughton brand is the best to be had. It should be thinned with turpentine or benzine. Made from the best pigments ground to a stiff paste in special hard drying oils. After drying, the surface is flat and the imperfections of the iron or steel are not visible. When dry it may be sanded to a smooth finish and becomes as hard as the iron itself.

25 and 100-pound drums.	Price per pound	\$0.20
Kegs.	Price per pound	.19
Barrels.	Price per pound	.17

Boughton Iron Filler or Leveling Putty

Furnished in paste form. To be applied on rough surfaces or for filling up the uneven or imperfect places in iron castings or steel before painting. Applied with putty knife the same as putty for large crevices, or it may be thinned to the consistency of cream for covering the whole surface and then sanded until smooth. It is always advisable to have a smooth surface on which to apply paint, as a much higher finish is produced. Made in same shades as our flat steel color.

10-pound cans.	Price per pound	\$0.17
25-pound cans.	Price per pound	.16
100-pound kegs.	Price per pound	.15
Barrels.	Price per pound	.14

Boughton Engine Paint

Our Boughton engine paint gives a smooth, glossy finish and practically eliminates the necessity of varnishing. Most generally used on gas, gasoline, automobile and steam engines. Boughton brand engine paint is particularly well known for its ability to stand the most extreme heat without showing any effects whatever. It will absolutely prevent rust or corrosion. It is made of ingredients which have a special tendency to grip tin, iron, steel and other metals effectively. Furnished in French yellow, Brewster and Coach greens, black, maroon, wine and royal blue.

1-gallon cans.	Price each	\$6.00
5 and 10-gallon cans.	Price per gallon	5.90
Barrels.	Price per gallon	5.80

For aluminum heat-proof paint, vermilion or carmine shades, add \$1.00 per gallon to above prices.

Boughton Blue Lacquer

Lacquer is used to prevent rust on steel or iron pulley surfaces, steel shafting, and all kinds of highly finished metal surfaces. Add considerably to the attractiveness of machinery or small engines for selling purposes as well as to the appearance in machine shop or factory. Also used on tin and metal cans of all kinds, lamp frames, shades, etc.

1-gal. cans.	Price each	\$2.50
5-gal. cans.	Price per gal.	2.40
Barrels.	Price per gal.	2.30

Boughton Anti-Rust Lacquer

Same as above only transparent. Made for preserving highly polished metal surfaces, such as shovel blades, steel shafting, etc. It is very tough and durable and dries rapidly.

5-gallon cans.	Price per gallon	2.30
Barrels.	Price per gallon	2.20

Boughton Brand

Ready Mixed Paint

Boughton Ready Mixed Paints are superior to ordinary hand mixed paints for the reason that it is impossible to thoroughly mix with a paddle the necessary amount of linseed oil that the pigments will take. All of our paints are ground and reground by machinery, which produces a uniform color that is practically impossible in paints mixed by hand. When the pigments are thoroughly ground with the oil, the spreading qualities of the paint are noticeably improved, and because of this fact, this paint is the most economical to use.

A hand mixed paint will show the effects of the weather in much less time than a good machine-mixed paint.

Boughton

There is a constant demand for a ready mixed paint at a moderate price. This grade is not a cheap composition paint, but is made of pigments and oils thoroughly mixed and ground to the utmost fineness which will spread and work easily under the brush. The quality and weather resisting properties surpass paint that costs a great deal more per gallon, thus giving the greatest possible value for the money.

Covering capacity is about 250 square feet to the gallon, two coats.

Boughton Marine

This is our highest grade of paint, originally made for use on wooden and metallic surfaces of vessels, yachts and other marine painting, where a paint is subjected to the most severe tests of wind, water and sun. It has given satisfaction for so many years that we highly recommend it for painting all exterior surfaces. It is made of absolutely pure ingredients and has a covering capacity of 250 to 300 square feet to the gallon, two coats.

Note: All shades except 458, 419 and 433 take regular prices. See following tables for special prices.

Boughton Floor Paint

For all Inside Floors

Boughton Brand Floor Paint is for inside use only, and is made to withstand the severe wear which it naturally receives. It is made of carefully selected ingredients, the most adhesive pigments prepared in conjunction with the hardest drying and most durable varnishes. Will dry over night holding up a good, lasting gloss which is brilliant, durable and sanitary, and at the same time decorative. It is manufactured in variety of colors so that shades may be selected to harmonize with other interior decorations and furnishings. It does not settle and may be scrubbed with soap and water without diminishing the quality of the finish. Boughton floor paint is easily applied and satisfactory results may be obtained by an inexperienced person. It will not crack, peel or fade, but tends to protect and preserve the floors. One gallon covers about 250 square feet, two coats. Put up in cans of 1 gallon, 1/2 gallon and 1 quart. Write for Color Card.

Single quart cans.	Price each	\$0.90
One-half gallon cans.	Price each	1.80
One gallon cans.	Price each	3.30

Boughton Porch Floor Paint

A Washable Exterior Paint

Especially prepared for outside exposure such as porches, steps, decks of vessels and similar surfaces that require frequent scrubbing and cleaning and receive extremely hard wear. It is made of carefully selected ingredients, pure linseed oil and the most adhesive pigments. It dries perfectly with a high lustre. It will not crack, fade or peel off, special care having been taken to overcome these objections. It imparts a tough, elastic and durable surface that will not only withstand the rain, snow and ice, but also extreme heat and cold. One gallon will cover about 300 square feet, two coats. Write for Color Card.

Quart cans.	Price each	\$1.40
One-half gallon cans.	Price each	2.60
One gallon cans.	Price each	5.00

Boughton Flat Wall Paint

A Washable, Flat, Interior Finish

A high grade washable flat wall finish for interior use on plaster, wood, metal, etc. Boughton Flat Wall Paint will not peel, but adheres to any surface applied. The white does not turn yellow. Particularly recommended for homes, churches, office buildings, hospitals, hotels, and all places where a sanitary artistic washable wall finish is desired. It is neither an oil paint or an enamel, but a beautiful combination of the two. For the work intended it accomplishes more than either one possibly could. It can be applied over old paint on walls, ceilings, woodwork, and metal ceilings with perfect success. It flows like oil paint, easily and smoothly from the brush. One gallon will cover about 300 square feet, one coat. Write for Color Card.

Boughton Varnish Stain

For all Kinds of Interior Work

Boughton Varnish Stains may be used on either old or new work, giving the effect of staining and varnishing in one application. The stains are very rich in tone and are made from the most transparent colors, and dissolved in special penetrating oils, thus insuring the greatest penetrating power. They are very durable and are particularly adapted for all kinds of interior woodwork; covering up scratches, marks, etc. They dry quickly and leave a brilliant, glossy finish. Not affected by soap nor hot or cold water. Unexcelled for general household use—floors, front doors, furniture, screens, wicker and porch furniture, linoleum, etc. One gallon covers about 300 square feet, two coats. Write for Color Card.

Boughton Barn, Roof and Metal Paint

In offering Boughton Barn, Roof and Metal Paint to our customers we are confident that they will be thoroughly satisfied after the first trial. A good coat of Boughton Paint will add from five to eight years to the life of a barn. It is made of high grade metallic pigments and natural oxides ground perfectly by modern machinery and mixed with pure linseed oil. For best use on barns, metallic and shingle roofs, out-buildings, iron fences, mill and factory buildings, freight houses and cars, depots, coal sheds, bridges, water tanks, elevators and all building surfaces, either iron or woodwork, exposed to the effects of the weather. Absolutely rust and weather proof and will not crack or blister. One gallon covers about 250 square feet, two coats. Write for our color card.

Single gallon cans. Price each.....\$2.20
Five and ten gallon cans, per gallon.....2.10
Full barrels, per gallon.....2.00

Boughton Wagon and Implement Paint

The life of a wagon or an implement of any kind can be prolonged fifty per cent if it is kept covered with a good coat of paint. Boughton Wagon and Implement Paint is a preservative, as it tends to prevent deterioration and rust, and will withstand the wear and tear to which it is subjected. It may also be used where a durable gloss finish is desired. Varnishing is unnecessary, as it dries quickly, leaving a brilliant, durable luster. Used mostly for painting wagons, trucks, heavy vehicles and implements of every description, pumps, windmills, etc. Write for our color card.

One gallon cans. Price each.....\$4.50
One-half gallon cans. Price each.....2.40
Quart cans. Price each.....1.30

Prices cover all shades except vermilion, which takes an advance of 75 cents per gallon.

Boughton Screen Paint

A screen paint that will stay glossy and will not clog the meshes. Used for screen doors and sleeping porch screens. Can be used for screen door frames as well. Write for color card.

Made in two shades of green, also in black.

Boughton Damp Proofing Paint

This is a damp proofing paint especially recommended for use above the ground level on the interior stone, brick or concrete walls to exclude dampness.

It penetrates readily into the pores of the stone, brick or concrete so that the seal cannot be broken by abrasion. It unites so thoroughly with the wall that plaster may be applied directly upon the damp-proof coating without danger of elevating off.

Barrels. Price per gallon.....\$1.60

Boughton Enamel

Boughton Brand White and Tinted Enamel produces a very high gloss and an artistic washable, porcelain-like surface. It is durable and sanitary, dries hard in from 12 to 14 hours, producing a smooth, hard and durable finish which is not affected by moisture or heat. Exceptionally good for decorative work and can be applied on any surface, such as walls, furniture, frames, willowware, benches, etc. Can be easily cleaned with damp cloth or soap and water. Can be applied over old paint or enamel with perfect success. Write for our color card.

Boughton Shingle Stain

Made of creosote and other wood-preserving and penetrating oils, for preserving shingles, clapboards and exterior woodwork. They penetrate the wood and prevent moisture from causing dry-rot, or injury from insects or worms. On new shingle roofs life of shingles can be doubled by dipping. Prepared in all the beautiful shades, such as brown, weather brown, green, moss green, light red, red and yellow.

One gallon brush coats 150 square feet, one coat. Two and one-half gallons dip 1000 shingles, one-third length. Three gallons dip and brush-coat 1000 shingles. Write for miniature set of shingles, showing colors.

One gallon cans. Price per gallon.....\$2.50
Five and ten gallon cans. Price per gallon.....2.30
Barrels. Price per gallon.....2.20

Boughton Creosote Oil

Coal Tar Creosote Oil is recognized everywhere as the best wood preservative that has stood the test of time under all conditions. This oil is a pure coal tar distillate from which all objectionable properties of crude creosote oil have been completely eliminated. The railroads and steamship companies have always found Creosote Oil to be the best wood preservative and they continue to use it to protect their vast properties against decaying bridges, ties, water tanks, wharfs, docks and trestles. We highly recommend it for use on fences, tanks, walks, silos and windmills.

Non-Fouling Enamel Paint

The best paint on the market for racing boats, producing a smooth, elastic non-absorbent surface which increases the speed of a yacht or boat very materially. It positively will not foul, and boats do not require repainting during the season.

Made in three colors: Green, red and gold.	
1-gallon cans. Price each.....	\$18.00
1/2-gallon cans. Price each.....	9.20
1-quart cans. Price each.....	4.70

Anti-Corrosive Paint

For Iron and Steel Boat Bottoms

This paint positively prevents pitting, and is strongly recommended for application as a first coat or base on which to apply our Anti-fouling composition.

It is made in one color only: Dark maroon.
Applied alone it is a most excellent composition for vessels in fresh water.

1-gallon cans. Price each.....	\$9.00
--------------------------------	--------

Anti-Fouling Composition

This composition will prevent all kinds of marine growths. While it contains chemicals which destroy these growths, it is absolutely free from any ingredients which are injurious to iron or steel.

It hardens to a smooth lacquer-like finish and will stick both above and below the water line.

It will not saponify or peel, and does not wash off as the result of the friction of salt water.

Made in two colors: Bright red and yacht green.	
1-gallon cans. Price each.....	\$14.00

Copper Paint

For Use on Wooden Hulls

This paint is made for use on wooden hulls and is preserving, lasting, economical and non-fouling. Its ingredients are combined under a most skillful process and it contains a greater percentage of pure copper than any other paint on the market.

It has a smooth body, spreads well, is very tenacious, yields the finest results in protecting against worms and marine growths.

Made in three shades: Brown, Green and Red.	
1-gallon cans. Price each.....	\$6.50
1/2-gallon cans. Price each.....	3.50
1-quart cans. Price each.....	1.90

Yacht White Ready Mixed Paint

For top sides there is nothing equal to our Yacht White. It is a heavy-bodied, dense-covering white paint, which dries with an egg-shell gloss. It's the paint that lasts.

1-gallon cans. Price each.....	\$5.00
1/2-gallon cans. Price each.....	2.60

Bronzite

The permanent green paint. Bronzite is a permanent green paint made from the ore of kalamite. It is different from all other greens in that it may be depended upon to withstand for an indefinite time the action of sun and water and will not fade.

Used for bridges, barns, roofs, iron girders, iron railings, iron piping, implements, brick work, screen doors, store fronts, mail boxes, lamp posts, hydrants, structural iron work, and general painting.

Made in paste form, in six shades of green.

Aluminum Ready Mixed Paint

This paint produces a brilliant and smooth finish, is not affected by heat, cold or moisture and will not peel off.

Used for painting or repainting steam pipes, radiators, registers, automobile engines, picture frames, wood and metal surfaces.

Hygienic Kalsomine

"Germ-proof your walls" with Hygienic kalsomine. It possesses the practical advantage of great spreading power and easy working qualities. Does not settle like the various cement mixtures formerly sold as wall finishes, consequently there is no waste or necessity for straining. Its ingredients are ground exceedingly fine, thereby insuring a smooth, velvety surface. Prepared especially for the interior decoration of public buildings, theatres, school houses, churches, private residences, etc.

From a sanitary standpoint, Hygienic kalsomine is ideal, as it contains an odorless disinfectant which will absolutely germ-proof any surface to which it is applied. Furnished in powdered form, to be mixed with water, in 4-pound packages and in bulk. One pound has a covering capacity of approximately 150 square feet. Write for our color card.

Hygienic Kalsize

A preparatory wall size to be used in connection with Hygienic kalsomine and decorative colors, or any ordinary wall finish, paint or enamel. Fills the pores, prevents all suction and forms an elastic, non-crumbing surface previous to kalsomining. It is the most economical wall size on the market. One pound mixed with water will make over a gallon, with a covering capacity of about 800 square feet to the gallon.

Marine White Lead in Oil

Warranted for whiteness, covering capacity and durability. We have sold this brand for over a quarter of a century. It has always given satisfaction. Not a carbonate of lead like other brands of white lead, but will positively wear better and not chalk, peel or crack. Takes more lead and covers more surface, pound for pound, is whiter and brushes out evenly under the brush.

100-pound kegs. Price per pound	\$0.19½
50 and 25-pound kegs. Price per pound	.20
12½-pound kegs. Price per pound	.21
5, 2 and 1-pound cans. Price per pound	.24

We also stock Carter's white lead and National Lead Company's leads, such as Southern, Red-Seal, etc., and sell at prevailing market prices.

Red Lead in Oil

Red lead in paste form is made of pure linseed oil and red lead of highest purity ground exceedingly fine by machinery, and will stay in workable condition indefinitely, exactly as white lead does. Paint is made from it exactly as white lead paint is made from white lead paste, by simply adding more linseed oil and a little drier. It will not harden in the pail.

100-pound kegs. Price per pound	\$0.24
50 and 25-pound pails. Price per pound	.26

Steel Wool

Steel wool is a mass of fine fibre of steel resembling curled hair, which, while sharp, does not scratch, but will cut as smoothly as the finest abrasive material heretofore used. It is the best article for rubbing off varnish, shellac, etc., for various uses where sandpaper, pumice stone and other rubbing materials are used, and does the work more quickly. Being soft and pliable, steel wool adapts itself to the shapes of carvings, mouldings, etc., going into places where sandpaper will not reach. It is excellent for rubbing a first coat of varnish and if a particularly smooth finish is desired, use a little linseed oil.

Hy-Pol Furniture Polish

Hy-Pol is a high grade piano and furniture polish and is absolutely non-injurious. It is composed largely of such oils as are employed in the manufacture of varnish, thus serving as a food to old finishes.

An ideal polish for pianos, furniture, floors, interior woodwork, bathtubs, tiling, porcelain, chandeliers, leathers, etc., in fact for all varnished, waxed, enameled or japanned surfaces.

Dries quickly and leaves no greasy deposit.

Semdac Liquid Gloss

Semdac liquid gloss is the most efficient dusting, cleaning and polishing agent for household use. It cleans woodwork, furniture, hardwood floors, metal and enamel surfaces better and quicker than soap and water. It softens and removes every trace of dirt and grime, leaving the surface treated clean, bright and with a lustrous polish.

For polishing such highly finished surfaces as pianos and automobile bodies, Semdac has no equal. It cannot harm the finish, but can and does restore the original polish, making the object treated like new.

H.Channon Company Chicago

Boughton Brand Varnishes

In presenting our Boughton brand of varnish, we take exceptional pride in being able to give our customers varnishes for general or special uses which for years have given entire satisfaction to some of the most critical users. For example, in our Boughton floor varnish we have a free flowing varnish drying hard over night with a brilliant finish that will not mar under severe usage. Water will not injure or cause it to turn white. Boughton interior finishing varnish will work very freely under the brush and has a greater body than a large number of high class varnishes today on the market. No matter what they may be, we can take care of your varnish requirements.

Floor Varnish

Our Boughton Floor Varnish is unusually tough and elastic. It is heel proof, water and weather proof and will not scratch, mar white or become sticky. For finishing floors in offices, hospitals, public buildings and fine residences, it cannot be surpassed. Will give a beautiful lustre to your old floor and woodwork. Used on linoleum it will bring back its bright, new appearance. Dries dust free in about fifteen minutes and will dry hard over night. Will stand continuous cleaning and washing.

Gallon cans	\$5.50
Half gallons	2.80
Quarts	1.50
Pints90

Special Floor Varnish

An excellent varnish and capable of giving the best service. We are confident in saying that, for the price, it is impossible for you to obtain a better varnish, as it works easily under the brush, flows out smoothly, and dries hard over night with a good lustre. Can also be used on all interior woodwork where a bright, new finish is desired.

Gallons	\$4.00
Half gallons	2.10
Quarts	1.10
Pints70

Interior Finishing Varnish

Adapted for all kinds of interior wood finishing except floors. It is pale in color; dries dust free in from four to six hours and absolutely dry in twelve to fourteen hours. Is tough, elastic and durable. Will not crack, blister or sweat and brings out the natural beauty of the grain of either hard or soft wood.

Gallons	\$3.00
Half gallons	1.60
Quarts90
Pints50

Interior Rubbing Varnish

Of exceptional quality and particularly recommended for all high class work where a beautiful finish is desired. Dries dust proof in five hours. Sets well over night and can be rubbed to a beautiful dull finish in from two to three days without sweating out, or polished to hard finish wherever desired.

Gallons	\$4.00
Half gallons	2.10
Quarts	1.10
Pints70

Furniture Varnish

For touching up or revarnishing old furniture, such as desks, chairs, tables, stools, etc. Has a fine finish, is very elastic and durable. It is remarkable how a small quantity of Boughton Furniture Varnish will brighten up furniture and make a vast improvement in the appearance of offices and homes.

Gallons	\$3.20
Half gallons	1.70
Quarts90
Pints50

Marine Spar Varnish

A high grade outside spar varnish, very elastic, hard drying, and has maximum life. The component parts are especially assembled to resist wear, moisture, harsh weather conditions, etc., and will not turn white when submerged in water. Has excellent working qualities and its great durability has made it most serviceable for all marine work, as well as for store fronts, outside doors, porch floors, outside ceilings, etc. Will not mar or scratch white. Owing to its great elasticity, plenty of time must be allowed to dry. Dries dust free in about six hours, and becomes thoroughly hard in from 24 to 36 hours.

Gallons	\$7.00
Half gallons	3.80
Quarts	2.00
Pints	1.00

Spar Varnish

This varnish is especially prepared for outside use, and will stand severe usage. Recommended for all outside work, such as window sills, vestibules, outside doors and ceilings, porch floors, marine work, etc.

Gallons	\$6.00
Half gallons	3.20

Pints90

Automobile and Carriage Varnish

Automobile finishing varnish. Price per gallon	\$9.00
Automobile rubbing varnish. Price per gallon	6.50
Automobile pale body rubbing varnish. Price per gallon	7.00
Automobile heavy gear varnish. Price per gallon	9.00
Coach finishing varnish. Price per gallon	5.00

Above prices are for single gallon cans.
Advances 10 cents per gallon for half gallon cans.
Advances 20 cents per gallon for quart cans.
Advances 40 cents per gallon for pint cans.

Valspar Varnish

Valentine's Valspar is the only varnish in the world that is absolutely waterproof and won't turn white in water. Dries dust-free in two hours and hard ever night, making it suitable for all interior as well as exterior work, and its waterproofing properties and exceptional durability also make it the best varnish for boats and marine use. Is pale in color and heavy in body. Works easily and flows freely, giving a full brilliant coat and may be rubbed in 24 hours. One gallon will cover 500 square feet. It is truly the one varnish for all uses and the best varnish for every use.

One gallon.	Price each	\$9.50
One-half gallon.	Price each	4.80
One quart.	Price each	2.60
Pint.	Price each	1.40
Half pint.	Price each	.80

Ad-el-ite Paint and Varnish Remover

In liquid form. Will take off any thickness of paint, varnish, shellac or enamel. Will clean to the bare wood almost instantly, and leave the wood in perfect condition for refinishing. Is free from acids, alkalis or water and positively will not raise or bleach the grain of the finest veneer. Also used for cleaning old paint brushes, painted glass surfaces and for softening old putty. Especially adapted for floors or all horizontal surfaces.

One gallon can, each	\$6.00
Half-gallon can, each	3.20
Quarter-gallon can, each	1.70
Pint can, each	1.00
Half-pint can, each	.60

24 Paint and Varnish Remover

Ad-el-ite 24 paint and varnish remover has the same qualities as our regular remover, but being in heavy liquid form, is ideal for upright, overhead surfaces, panel-work and for exterior use. Stays where it is put, and remains soft 24 hours or more. Prices same as the regular liquid form.

Boughton Shellac Varnish

For use over stains and fillers prior to varnish or wax coat. Makes a tough, elastic, non-bleeding foundation over which finishing coats may be brought to high degree of smoothness and polish. Especially good over sappy wood, such as pine and Oregon fir, etc.

1-pound cans.	Price per pound	.24

Boughton Liquid Wood Filler

A perfect surfacer for all close grained wood such as birch, cherry, pine, cypress, etc.

It is perfectly transparent and will not stain the lightest color of wood or raise the grain. Stops absorption and leaves a perfectly hard, smooth surface ready for varnishing.

Made in natural, antique oak, walnut, mahogany, cherry and golden oak.

1-gallon cans.	Price per gallon	\$3.00
1/2-gallon cans.	Price per can	1.60
1-quart cans.	Price per can	.80

Dust-Laying Floor Oil

A high grade special oil very popular for use on unfinished wooden floors. Especially adapted for office, warehouse and large store floors. It is sapitary and lays the dust. May be applied with either cloth, brush or mop.

5-gallon cans, per gallon	\$1.50
1-gallon cans, per gallon	1.60

Durable Lac Oil

A special varnish oil which doubles the life of varnish or paint. This oil will add 25 to 50 per cent to any varnish or paint. It is a compound of vegetable paint oils, from which the perishable ingredients have been removed, and the more durable parts combined to form an oil of remarkable durability. It dries in about 12 hours with a tough, elastic film. Entirely waterproof and will resist acid, alkali, brine, ammonia and heat up to 800 degrees. It toughens any varnish or paint in proportion to amount used.

Mix one-quarter of this oil with floor, interior finishing, outside spar or any other high priced varnish. This reduces its original cost and doubles the wearing qualities of the varnish.

1-gallon cans, each	\$3.00
5-gallon cans, per gallon	2.80
1/2-barrels, per gallon	2.70
Full barrels, per gallon	2.60

Boughton Cement Floor Coating

(Transparent)

This is a protective liquid coating for cement floors, where it is desired to preserve the original appearance of the floor. It prevents dusting and possesses excellent wearing qualities.

Covering capacity, about 200 square feet to gallon, two coats.	
Barrels and half-barrels.	Price per gallon
5 and 10-gallon cans.	Price per gallon
1-gallon cans.	Price per gallon

Automobile Colored Varnish

Boughton Automobile colored varnish is made of the best colors procurable and best wearing automobile varnish combined. It will resist the action of oils and water and a good washing with soap and water and the stiff stream from the hose will not dull its lustre. It is exceptionally hard and shows no spots or streaks and will not fade. Applied very easily. Used for automobile and carriage bodies, bicycles, wagons, motorcycles, etc. Made in exclusive grays, lavenders, greens, reds, blues, yellows, browns, maroons, etc. Write for color card.

1-gallon cans.	\$5.00
1/2-gallon cans.	4.10
Quart cans.	2.20
Pint cans.	1.20
Permanent red, \$0.80 per gallon additional.

Prices including handles.	Dozen	Each
16 inches long	\$28.00	\$2.80
18 inches long	32.00	3.20
24 inches long	43.00	4.30

Capital Factory and Garage Brush

Made on hardwood block, with two handle holes. Designed for sweeping cement floors, rough wood floors and sidewalks. The center of this brush is made of imported fibre which cuts the dirt loose and wears like wire; the outside is made of Tampico fibre which is the nearest substitute for bristle that can be had. The Tampico fibre center will cut dirt loose that bristle or Tampico would skim over.

There is great demand for a brush for this class of sweeping and we recommend this as the most suitable.

Prices including handles.	Dozen	Each
No. 170. 16 inches long	\$28.00	\$2.60
No. 171. 18 inches long	32.00	3.00

Painters Wire Brushes

For Cleaning and Scrubbing Wood-Work, Floors, Stone, Brick, Cement and Iron

These brushes will do better and quicker work than any sandpaper, steel wool or similar abrasives. For removing old varnish they are unequalled and leave the surface with an "egg-shell" finish and the grain open and clean, ready for a new coat of filler. For cleaning stone, brick, cement and metal they are equally efficient and no painter, wood finisher, contractor, iron worker or boat builder can afford to be without them. They are indispensable to any up-to-date workman who now uses sandpaper or steel wool. They actually cost less than sandpaper, because of their long life.

Flat Wire Casting or Foundry Brush

This brush is made of first quality flat tempered steel wire on well finished hardwood blocks and designed for cleaning castings and general use in foundries and similar institutions. It can also be effectively used for removing paint from iron and stone surfaces. Blocks made 4 or 5 rows wide and 10 rows long.

No. 2. Wires 3 inches long, 4x10 rows, block 7½x2½ inches.	
Price per dozen.....\$6.00	Each.....\$0.60
No. 6. Wires 3 inches long, 5x10 rows, block 7½x2½ inches.	
Price per dozen.....\$6.50	Each.....\$0.65
No. 7. Wires 4 inches long, 5x10 rows, block 7½x2½ inches.	
Price per dozen.....\$7.00	Each.....\$0.70

Flat Wire Scrub Brush

This brush is made similar to the flat wire casting brush, with wires 1½ inches long. It is made particularly for scouring and scrubbing stone, iron and metallic surfaces, such as bridges, boilers, engines, etc., from which it is necessary to remove blistered paint scabs, rust or other matter. The short wires will not bend over and get out of shape quickly, and the solid block prevents them from working through the back.

No. 105. Wires 1½ inches long, 5x10 rows, block 7½x2½ inches.	
Price per dozen.....\$6.00	Each.....\$0.60

Round Wire Scratch Brush

Curved Long Handle

Made of No. 31 black round tempered steel wire. Adapted for architectural iron work, figured brass and finished castings. Extensively used for pattern and braziers work, also as file cleaning cards. It will be found very effective for getting at crevices, grooves, corners and other out-of-the-way places, such as under the eaves of buildings and for removing rust, old paint and discolorations from iron, stone or brick surfaces where only light work is necessary.

No. 177. Wires 1½ inches long, 4x19 rows.	
Price per dozen.....\$6.00	Each.....\$0.60

Round Wire Scratch Brush

Shoe Handle

For use on metal and painted surfaces where narrow brushes are required.

No. 1781. 4 rows wires 1½ inches long.	
Price per dozen.....\$6.50	Each.....\$0.65
No. 1784. 2 rows, wires 1½ inches long, for penetrating into small cracks and seams.	
Price per dozen.....\$6.00	Each.....\$0.60

Curved Hand Scrub Brush

Made of No. 31 round black tempered steel wire and designed for removing paint, varnish and wax from hardwood floors and for cleaning and preparing flat varnished surfaces for refinishing. Recommended for use on floors in connection with paint and varnish remover. The curved face of this brush increases its efficiency, as it gives the user a greater leverage than ordinary straight or flat faced brushes.

No. 1779. Wires 1½ inches long, 9x21 rows, block 7x3 inches.	
Price per dozen.....\$9.00	Each.....\$0.90

Scrub and Scratch Brush

No. 1780. Made of No. 31 gauge round black tempered steel wire and is designed for use on large surfaces, such as sides of buildings, doors, windows, floors and finished hardwood work.

It takes the place of No. 1 sandpaper—does the work quicker, easier and leaves a much smoother finished surface.

Wires 1½ inches long, 6x19 rows, block 7½x2½ inches.	
Price per dozen.....\$7.00	Each.....\$0.70

No. 177. Made same style as No. 1780, of No. 31 round wire, very heavily filled. Suitable for cleaning metal surfaces of all kinds, also for cleaning exterior work of stone-brick, terracotta and rough painted surfaces. The heaviest and most serviceable brush made.

Wires 1½ inches long, 5x11 rows, block 7½x2½ inches.	
Price per dozen.....\$11.00	Each.....\$1.10

Round Steel Wire Duster

This handy brush is made of No. 31 round tempered steel wire and takes the place of an ordinary bristle duster. Used for cleaning molded engravings and in crevices and cracks. It is valuable when crack filler is used, as it penetrates into the cracks and takes all dirt and foreign substances out so that the filler will stay in the crack. A practical brush for cleaning out the base of the walls where a bristle duster is of little or no use. It enables the user to remove all the loose or scaly paint and makes a clean, finished job, close to the floor.

No. 1778. Wires 2½ inches long, 6 rows, block 2½x1½ inches.	
Price per dozen.....\$7.50	Each.....\$0.80

Brooms

For Mills, Factories, Warehouses, Stores, Homes, Streets, Tracks, Frogs and Switches

No. 6-C

No. 4

No. 2

Nos. 10 & 11

No. 9

No. 6-C

For use in mills, factories, warehouses, stores and general heavy sweeping.

A strong, well made broom, built for strength, durability and satisfactory sweeping. Made in all corn or corn and bamboo mixed. We recommend the 36-pound bamboo mixed as the bamboo gives additional strength and elasticity and cuts loose the dirt that corn would skim over.

Made in three sizes. Unless otherwise ordered, 36-pound bamboo mixed will be shipped.

Weight per dozen, pounds.....	32	36	40
Price each.....	\$ 1.30	\$ 1.40	\$ 1.50

H.Channon Company Chicago

Spraying Machines

For Applying Whitewash, Cold Water Paint, Disinfectants, Etc.

Style A

Style E

Style D

Style A. A favorite among all users of spraying machinery. It is recommended for those having a large amount of cleaning to do, continuously or at short intervals. Capacity equal to the work of 30 men with brushes.

Style E. For those desiring a portable machine it is highly recommended. Machine consists of pump similar in construction to Style D only trifle larger in capacity and construction, which is mounted on portable truck together with 30-gallon tank complete with agitator, as illustrated. Capacity equal to the work of 16 men with brushes.

Style D. This is the smallest machine of this type furnished. It is identically the same in construction as Style A, but has shorter pump cylinder and a few other modifications as shown in cut. Capacity equal to the work of 10 men with brushes.

Equipment

All the above machines are furnished complete as illustrated with spray pipe, cock and nozzle, extra spray tip, 200-pound pressure gauge, special galvanized sieve, follower wrench, one length 1-inch suction hose and discharge hose. Style A has 20 feet $\frac{1}{2}$ -inch discharge hose and Style D and E, 10 feet each.

Style A.	Net weight, 80 pounds.	Gross weight, 100 pounds.	Price each.....	\$70.00
Style D.	Net weight, 60 pounds.	Gross weight, 75 pounds.	Price each.....	48.00
Style E.	Net weight, 125 pounds.	Gross weight, 150 pounds.	Price each.....	70.00

Style J

Style J Sprayer

This machine is constructed along the same excellent lines as the other styles. Has brass cylinder, plunger rod, ball valves and brass seats. Will operate against a working pressure of 80 to 90 pounds. Well adapted for those having a small or medium amount of work to do.

Equipment

Furnished complete as illustrated with spray pipe, cock, nozzle, follower wrench and 10 feet $\frac{3}{8}$ -inch discharge hose. Net weight 30 pounds, gross weight 40 pounds.

Price each.....\$22.00

Capacity equal to work of 6 men with brushes.

Style 21 Sprayer

A general purpose sprayer and one of our most popular styles. It is portable, well balanced, light and has many improvements.

Pump cylinder seamless brass tubing, bronze ball valves, seats and all working parts of brass, rigidly bolted to 12-gallon tank. Is equipped with substantial 16-inch steel wire wheels. Has large iron air chamber, which insures a constant steady pressure, and will operate against 125 pounds pressure. Mechanical agitator operates at every stroke of the pump, and at the same time washes all sediment from suction strainer, preventing any possible chance of clogging.

Style 21

Equipment

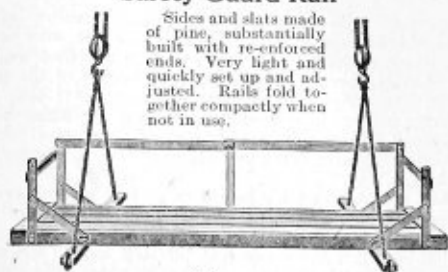

Furnished complete as illustrated and described with 10 feet Star Special $\frac{1}{2}$ -inch discharge hose and couplings, spray pipe, complete with a $\frac{1}{4}$ -inch cock, one Star nozzle. Weight 65 pounds.

Price each.....\$30.00

Ladders, Trestles and Stages

Safety Guard Rail

Sides and slats made of pine, substantially built with re-enforced ends. Very light and quickly set up and adjusted. Rails fold together compactly when not in use.

Stage

Rigid, safe, light and very easily attached to the platform.

Safety guard rails. Price each.....\$10.00

10 to 20 feet, per foot......56

22 to 24 feet, per foot......60

Unless otherwise specified, the 20-inch width will be furnished.

Extension Plank

This extension plank is made of selected Norway pine and is very light and strong. It is practical and most convenient for any room, no matter what size it may be. Used for papering, painting or calcimining, and may be carried up any stairway.

Painters' Falls

A set of painters' falls consists of two pairs (4) roller bushed wooden shell tackle blocks, each pair has a single block with becket and a double block without becket reaved with our first quality, strictly pure Manila rope and spliced into the becket of the single block; one pair (2) crossbars with rollers; one pair (2) 1-inch Manila rope stirrups with eyes spliced in each end with thimble in center; two 1/2-inch Manila rope guylines; one pair (2) steel cornice hooks and one pair (2) straps for use where hooks cannot be supported from roof.

Painters' falls are usually for a height of 50 feet or greater. In a 50-foot set of falls with single and double blocks 400 feet of rope are required, with 80 feet extra rope for each 10 feet longer. The guylines for 50-foot fall are furnished 50 feet long. Prices of painters' falls change with the price of Manila rope. We furnish falls of any size rope with blocks of any purchase desired.

Complete Painters' Falls (See Above)

Price of 50-foot falls with 5/8 rope, weight about 150 pounds,	\$42.00	For each 10 feet longer, 15 lbs., add.	\$4.50
Price of 50-foot falls with 3/4 rope, weight about 165 pounds,	46.00	For each 10 feet longer, 17 lbs., add.	5.00
Price of 50-foot falls with 7/8 rope, weight about 200 pounds,	55.00	For each 10 feet longer, 22 lbs., add.	5.75

Prices change with the market price of Manila rope.

Painters' Cornice Hooks

Made of 1 1/2 x 2-inch iron; height 37 inches, width 23 inches with 2-inch eye for tackle block hook.

Weight about 40 pounds per pair.

Price per pair . . . \$8.00

Painters' Stirrups

Made of 1-inch pure Manila rope with loops for slipping over cross bars to support the painter's stage. The eye at top has thimble for hook of tackle block.

Weight, about 6 pounds per pair

Price per pair . . . \$4.00

Cross Bars with Rollers

Made of hard maple, with turned roller. These are the cross pieces that go under the stage—the stirrup-eyes are slipped over each end. The roller sets up against the building.

Weight, about 12 pounds.

Price per pair . . . \$2.80

Painters' Straps

Slipped over timber to support stage when cornice hooks are not used. 1-inch Manila rope with short splice. 3 feet long when doubled. Weight, about 5 pounds.

Price per pair . . . \$2.80

Painters' Drop Cloths

Furnished any size.
Price per square foot . . . \$0.08

Rope Ladders

Manila Rope

Wire Rope

Manila Rope Ladders

Made of pure Manila rope with turned hardwood rungs. Hooks with thimbles at top. Flexible and easily folded up.

Price per foot . . . \$1.60

Wire Rope Ladders

Made with wire rope sides and iron rungs—is considerably stiffer than Manila rope ladders and are chiefly used for suspension in shafts, etc.

Price per foot . . . \$2.60

Boughton Brand Oil and Grease

In offering our Boughton brand of oils and greases to our customers, we take unusual pride in being able to produce oils and greases of exceptional quality. The demand for lubricants of established merit has been so great the last year that we are compelled to devote special attention to our improved and enlarged oil and grease department. Our statement to the effect that Boughton oils and greases are the best to be had, is confirmed by hundreds of our most critical customers who use none other than Boughton brand.

Steam Engine Cylinder Oil

Extra Dark

A very high grade of cylinder oil of superior quality. Has a very high fire test and is especially compounded to meet the requirements of steam engine cylinder oil. Recommended for stationary and traction engines of all makes.

Extra Amber

Practically the same as the extra dark and used for the same purpose. It is furnished in an amber color to meet the demands of those who desire oil of that character.

	Amber	Dark
Single-gal. cans, price each.....	\$1.20	\$1.10

Engine Oil

Extra

Extra engine oil is especially prepared for use on high speed engines, motors, dynamos, etc. Has amber color and can be filtered indefinitely. A fair trial will prove its worth.

Single-gal. cans, price each.....	\$0.80
Five-gal. cans, price each.....	3.50
	Wooden Steel
Half barrels, price per gallon.....	\$0.46 \$0.62
Full barrels, price per gallon.....	.42 .58

Extra Red

Used for the same purpose as Extra engine oil, but intended for those who prefer oil of a red color. Has equally as good lubricating qualities as our Extra engine oil.

Single-gal. cans, price each.....	\$0.80
Five-gal. cans, price each.....	3.50
	Wooden Steel
Half barrels, price per gallon.....	\$0.46 \$0.62
Full barrels, price per gallon.....	.42 .58

No. 1 Red Engine Oil

For the lubrication of line shafting and general farm machinery. This is a red oil, lower in gravity than our Extra red engine oil.

Single-gal. cans, price each.....	\$0.76
Five-gal. cans, price each.....	3.40
	Wooden Steel
Half barrels, price per gallon.....	\$0.44 \$0.60
Full barrels, price per gallon.....	.40 .56

Gas or Gasoline Engine Oil

Specially compounded oil for stationary gas and gasoline engines. Cylinders are very often ruined by the use of cheap oils. We are confident that a trial of our Boughton brand will convince you of its superior qualities. It is a strictly high grade oil and warranted pure and clean.

Single-gal. cans, price each.....	\$0.90
Five-gal. cans, price each.....	4.00
Half barrels, wooden, price per gallon.....	.52
Half barrels, steel, price per gallon.....	.68
Full barrels, wooden, price per gallon.....	.48
Full barrels, steel, price per gallon.....	.64

Boughton Machine Oil

Heavy

For lubricating heavy bearings and light running machinery we recommend our Boughton-brand machine oil. It is a heavy grade, red in color and very serviceable. Absolutely clean and carbonless. It is strained and filtered by a modern process which adds to its lubricating qualities.

Light

A light bodied oil for use on all kinds of farm machinery, portable engine bearings and wherever a light bodied oil is required. Color, light red.

	Heavy	Light
Single gallon cans. Price each.....	\$0.80	\$0.70
Five gallon cans. Price each.....	3.60	3.30
Half barrels, wooden. Price per gallon.....	.48	.41
Half barrels, steel. Price per gallon.....	.64	.57
Full barrels, wooden. Price per gallon.....	.44	.37
Full barrels, steel. Price per gallon.....	.60	.53

No. 1 Castor Machine Oil

A heavy grade of castor machine oil for use on light running machinery and open bearings where a lighter oil would run off.

Single gallon cans. Price each.....	\$0.96
Five gallon cans. Price each.....	4.20
Half barrels, wooden. Price per gallon.....	.51
Half barrels, steel. Price per gallon.....	.67
Full barrels, wooden. Price per gallon.....	.47
Full barrels, steel. Price per gallon.....	.63

No. 2 Castor Machine Oil

For winter use we recommend a lighter grade oil. No. 2 Castor is similar to our No. 1 in every respect but its viscosity, No. 2 being somewhat thinner.

Single gallon cans. Price each.....	\$0.90
Five gallon cans. Price each.....	4.00
Half barrels, wooden. Price per gallon.....	.50
Half barrels, steel. Price per gallon.....	.66

Lard Oil

We carry in stock the higher grades of lard oil only, but will secure the cheaper goods upon request.

Boughton Thread Cutting Compound

Made from the purest, non-gumming viscous oils, furnished in paste form to the consistency of soft grease, to be mixed with cold water. Will keep the machines clean. Tools will cut clean—no rust—no gum.

Herewith a few formulas for your guidance in estimating quantity required.

For thread-cutting on pipes, bolts and nuts:

Use a solution of 40 pounds of the compound to 50 gallons of water. Very heavy thread-cutting may require a solution of 1 to 8.

For difficult turret lathe work:

Use a solution of 50 pounds of the compound to 50 gallons of water. Ordinary lathe work will stand a solution of 1 to 16 parts, or 25 pounds to 50 gallons of water, while some shops use a solution of 1 to 24 parts for ordinary lathe work.

For drilling, milling and grinding:

Use 17 pounds to 50 gallons of water. Some shops use a solution of 1 part to 40 parts, or 10 pounds to 50 gallons of water.

For nut tapping:

Use 1 to 10 solution.

It will readily be seen from the above that a cutting oil can be secured at a cost of from three to sixteen cents per gallon, depending upon the nature of the work.

50-pound can. Price, per can.	8.00

Barrels and Half-barrels quoted on application.

Household Lubricant

A light colored, high-grade lubricating oil, intended for general household purposes, such as sewing machines, lawn mowers, typewriters, guns, bicycles, grindstones, etc.

Will not gum or corrode.

Furnished in newly patented cans.

	Price per Doz.	Price Each
Large cans:		
One-half pints.	\$2.00	\$0.20
Small cans:		
One-fourth pints.	1.60	.16

Miscellaneous Oils

Headlight Oil, Signal Oil, Perfection Kerosene, Sperm Oil, Cottonseed Oil, Fish Oil, First and Tempering Grades furnished in gallon, five gallon and ten gallon cans, and in half barrels and barrels at market prices. Any other market or special oils at prevailing market prices.

Boughton Automobile Oil

An automobile engine must be taken care of and fed properly, for without perfect lubrication an engine will soon wear out and be of no value whatever. It is poor policy to buy cheap oil for any automobile engine, for it is only the best oil that enables an engine to run with the highest possible efficiency.

Boughton Automobile Oil has stood every test of gravity, viscosity, fire, flash and freedom from carbon. A modern filtering process removes all excess carbon and insures the user against carbon and friction troubles. We have great confidence in our oil and highly recommend it for use in all automobile engines.

Boughton Motorcycle Oil

For any make of motorcycle or air cooled engine, Boughton Motorcycle Oil will be found suitable and economical. It is a perfect lubricator and will not congeal in the coldest weather. It is as clear carbonless as an oil can be and consequently the spark-plugs will not carbonize as is often the case when using cheaper oil. A fair trial of our Boughton Motorcycle Oil will prove its superior lubricating qualities.

5-gallon can. Price, per can.	\$5.00
1-gallon can. Price, per can.	1.20

Three in One Oil

Lubricates, Prevents Rust, Cleans and Polishes

Three-In-One-Oil is an oil compound that flows right to the heart of every bearing and friction point. It sinks down into the unseen pores of metal surfaces.

For Automobiles—Used for oiling self-starters, electric horns, speedometers, cone clutches, also automobile motor boat magneto etc.

For use in factories, offices and for all-light mechanisms, dynamos, electric fans, hardwood floors, dustless mops, etc.

1-ounce bottle. Price, each.	\$0.20
3-ounce bottle. Price, each.	.50
8-ounce bottle, (1/2 pint), factory size. Price, each.	1.00
3 1/2-ounce handy oil can. Price, each.	.50

Lesoyl

Lesoyl insures proper lubrication of all bearings. It contains only amorphous graphite from which all clay and foreign substances have been removed. Lesoyl, when mixed with oil, forms a perfect lubricant and much less oil is necessary than when using oil alone, thus reducing the oil bill, in some cases more than one-half.

Lesoyl carries a perfect lubricant graphite to all parts of the bearing surface. It will prevent hot bearings.

Lesoyl is a semi-fluid concentrate containing graphite especially prepared to insure the suspension of the graphite when properly mixed with lubricating oil or grease.

No. 1 Can, containing correct quantity of Lesoyl to mix with 5 gallons of lubricating oil or 10 pounds of grease.	
Per can.	\$2.00
No. 10 Can, for 50 gallons of oil, or 100 pounds of grease.	
Per can.	17.00

Tiolene Oil

"The Motor Oil That's Clean"

Tiolene—"The Motor Oil That's Clean"—is made especially for lubricating fine gas and automobile engines.

It is refined solely from Pennsylvania rock oil crude, by a process that preserves the full life of the crude, eliminates every particle of foreign matter, and retains only the absolutely minimum amount of carbon necessary to complete the lubricating properties of the oil.

The prime essential factors in motor oils are, first, to retain their body under high temperatures; second, to be free from gummy substances and to burn clean, leaving no carbon deposit. The improved process of manufacturing Tiolene, the careful filtration—not acid treatment—removes all sediment and foreign substances, making it as near a perfect lubricant as it is possible to refine and insures the auto owner against the multitude of annoyances and expense attached to carbon-full oils.

Tiolene is always uniform—fully guaranteed.

\$3.00 a year. That's the difference between using good or bad oil. One cent a day. It's certainly worth that much to be sure your engine is being properly lubricated. And the way to make sure that it is always properly lubricated is to buy Tiolene, "The Motor Oil That's Clean," in steel drums, and have it constantly on hand.

Tiolene is put up in 1 and 5-gallon cans, and 15, 31 and 55-gallon steel drums.

The steel drums are fitted with invisible faucets that insure safety in shipment—is fire-proof—air-tight—and makes an ideal storage equipment when free of its original contents.

Tiolene Light. A light bodied oil for lubrication of vertical gasoline engines where an oil of light body is required, flowing freely in cold weather.

Tiolene Medium. An amber-colored oil for lubrication of water-cooled gasoline engines, requiring a rich lubricant. It holds its body under extreme heat.

Tiolene Ford Special. Exclusively used for Ford cars.

Tiolene Heavy. For both air and water-cooled gasoline engines. It holds up compression under extreme heat. This oil is especially suitable for lubrication of motorcycles, where a medium heavy bodied oil is desired.

Tiolene Extra Heavy. This oil is especially suited for motorcycle and tractor engines.

Tiolene Transmission Oil. A heavy, dark fluid oil for transmission and differential lubrication.

Buy Your Oil in Steel Drums

Automobile Lubricating Greases

Gredag Automobile Grease

For transmissions, differential and other gears, cups, wheel hubs, universal joints, pumps, steering worms, chains, etc.

Especially prepared for automobile, motor boats and motor-cycle lubrication.

Gredag is better than other graphite greases, because of the absolute purity and the soft, unctuous nature of Acheson graphite which is found in no other grease.

Gredag is better than any plain grease, because the graphite establishes a durable anti-friction surface over the parts lubricated, greatly assisting lubrication and preventing wear. Moreover, the

solid graphite does not squeeze out from between the rubbing surfaces under heavy pressure as a grease would do. This is of vital importance to the long life of gear teeth, and of shaft bearings such as those in the gear cases, subjected to terrific strain and sudden shock.

Gredag withstands a very wide range in temperature changes and easily gives at least double the service of plain grease.

No. 31. Semi-fluid. For gears enclosed in oil-tight cases and running quietly.

No. 32. Soft. For general use. Ideal for wheel hubs, shackle bolts, grease cups, roller and ball bearings.

No. 33. Medium. For cup and general use, universal joints and steering gears.

No. 63. Medium. A fibre grease for general use, excellent for noisy gears.

No. 41. A medium light lubricant designed especially for transmissions and rear axles. It combines the advantages and eliminates the disadvantages of all other lubricants to a really remarkable degree. Stays in the gear cases; will not chafe. Eliminates noise and reduces wear to a minimum. Especially popular for worm drives.

No. 42. A slightly heavier grade than No. 41. Extensively used for Ford differentials on account of its consistency and great lubricating qualities.

Cook's Lubricant

Used for automobile gear cases, and for all kinds of gears in industrial plants where a soft mineral oil grease is desired. It is also very fine for lubrication of chain drives in industrial plants.

Gears in an automobile when improperly lubricated, waste a large percentage of the power generated, and soon grind themselves to pieces. Gears play an important part in the operation of a car, and when properly lubricated mean more power—easier car operation—less noise and less expense.

Cook's lubricant will not run or leak out of a gear case; cannot be thrown off the gears; will not drip from the gears and settle in the bottom of the case; cannot be cut up and packed aside by the gear teeth in action and is not affected by temperature changes.

Cook's lubricant overcomes the wastefulness of gear oils and the many non-lubricating disadvantages of the numerous so-called gear lubricants and ordinary greases.

Made in three consistencies:

Soft—Used in gear cases of new cars and cars which require a light consistency of grease.

Medium—A general all around consistency.

Hard—For use in gear cases having worn bushings or extremely noisy gears.

Grease in Tubes

This is the quick, modern, clean, improved method of applying grease to grease cups, springs, transmissions and differentials.

Grease in tubes is economical. Just the right amount of grease goes just where it is needed—and the last particle is as pure a lubricant as the first. A compact, easily carried outfit.

Put up in cartons of three tubes each, Lincoln Highway Kit.—Contains one tube each of gear compound, cup grease and spring grease.

Separate Kits.—Contains three tubes of either grades of grease as above.
Price per kit.....\$2.00

Dixon's Graphite Automobile and Machinery Lubricants

Dixon's Motor Graphite

The purest and most carefully selected grade of flake graphite ground to impalpable fineness. Its function is to eliminate friction and wear of parts and to increase power. Use it in cylinders, on chains, springs, tires, wheel-rims, bearings where-ever friction occurs.

1/2-pound tin cans. Price each.....	\$1.00
5-pound tin cans. Price each.....	8.00

Dixon's No. 680 Non-Leak Graphite Grease

Car owners who have been annoyed by differential lubricant leaking out on the brake drums and wheels, will appreciate the merit of Dixon's No. 680. It "stays put." If the old lubricant is removed before No. 680 is put in, there will be no more trouble with leaky axles. No. 680 is a special adhesive lubricant not intended for transmission cases. It is recommended for differentials only when No. 677 or No. 675 will not do the work.

Dixon's No. 676 Graphite Heat Resisting Grease

No. 676 is the best grease for universal joints, water pump cups, overhead valve cups and clutch thrust collars. It positively will not melt and run out. The grease should not be used on gears.

1-lb. tin cans. Price ea. \$0.70	25-lb. tin cans. Price lb. \$0.44
5-lb. tin cans. Price ea. 3.00	50-lb. kegs. Price lb. .40
10-lb. tin cans. Price ea. 5.00	100-lb. kegs. Price lb. .36

Dixon's No. 677 Graphite

Transmission and Differential Grease

A graphited grease of just the right consistency for all transmission and differential gears, except those intended to be lubricated with light oil. It is the grease the "speed kings" use. There is nothing like it on the market.

1-lb. tin cans, per can. \$0.70	25-lb. tin cans, per lb. \$0.50
5-lb. tin cans, per can. 3.00	50-lb. kegs, per lb. .50
10-lb. tin cans, per can. 5.00	100-lb. kegs, per lb. .40

Dixon's Graphite Cup Grease

Cup greases containing fine flake graphite reduce friction to a minimum. Use Dixon's No. 3 except in hot climates where No. 3 is better. For all grease cups, wheel spindles, etc. By using these high grade graphite greases the bearings soon acquire the well known graphite polish that eliminates friction and causes easy running.

Write for booklet "Where to use Dixon's Graphite Auto Lubricants."

Lubricating Grease, Axle Grease and Boiler Compound

Albany Cup Grease

Albany grease is a pure tallow compound with a low melting point that does not contain any metal-eating acids or other harmful matter. It does not cake, clog or harden in any grease cup or bearing. It is used by large mines, steel works, railroads, mills, industrial plants and factories for lubricating engine bearings, line shafting and all kinds of machinery. Also for use in automobile grease cups, axle caps, roller and ball bearings and (soft numbers) in all gear cases. Drip pans are unnecessary because there is nothing to drip. As the bearing needs it, Albany grease flows; when it stops, the lubricant stops.

Nos. 0, 1, 2, 3, X, XX and XXX carried in stock.

All consistencies or numbers of Albany grease are of the same quality, but each have a different melting point to suit different operating conditions. To know what number to use under any condition, simply follow these rules:

For bearings that are running cold, use the **soft** numbers—No. 0 or No. 1.

For bearings that are running warm, use the **medium** numbers—No. 2 or No. 3.

For bearings that are running hot use the **hard** numbers—No. X, No. XX or No. XXX.

Gredag

Factory and Mill Grades

The factory and mill grades of Gredag are made for the best service and have no equal as a grease lubricant. The grease stock is accurately blended with 99.9 per cent pure gritless Acheson graphite. A continuous use of Gredag will make it possible to eliminate break-downs, hot bearings, etc., due from improper lubrication.

A reduction in frictional load of from 10 to 30 per cent where plain bearings are used can be assured if Gredag is continuously used. It is the only graphite grease that can be successfully used on roller or ball bearings.

Made in 5 consistencies:

No. 50. Fluid. Used for ring oil bearings and wherever a fluid grease is required. It can be used in a squirt can.

No. 51. Semi-fluid. For use wherever a semi-fluid is required. Can be used in a squirt can.

No. 52. Soft. For cup and general use. Very fine for fan motor lubrication.

No. 53. Medium. For cups, open bearings and general use. This grade is very popular for general cup use.

No. 55. Hard. Used extensively in compression cups and open bearings. Has a very high melting point.

Metla-Cota

The Boiler Cleaner

Metla-Cota is a preparation for cleaning and coating the interior heating surfaces of steam boilers, plates or tubes. Where boilers are scaled, Metla-Cota will remove; where scale is removed, Metla-Cota will coat it. It penetrates the scale, loosening it from the metal and paints or coats the metal with a soluble coating which prevents the formation of scales.

Metla-Cota is non-corrosive and does not affect the steaming qualities of the boiler.

Can be used in any plant, including steel plants, canneries, laundries, mills and factories of all kinds, breweries, packing houses, hotels, etc.

Metla-Cota is put up in paste form, in barrels, half barrels and 100-pound kegs.

Before using, add sufficient hot water to reduce to a liquid form. The feed varies according to the condition of the boilers. Where boilers are old and badly scaled, recommend one quart per 100 H. P. per 24 hours, the quantity to be reduced from time to time as conditions improve. Where boilers are new or fairly clean, 1/2 pint per 100 H. P. per 24 hours will be found sufficient to keep them in prime condition.

Barrels and half barrels. Price per pound.....\$0.20

100-pound kegs. Price per pound......25

Occidental Boiler Compound

A vegetable compound which keeps water from foaming, prevents pitting and will not injure metal or packing. Will clean boilers and keep them clean. Full directions accompany each shipment.

U. S. G. Co.'s Graphite Lubricants Mexican Boiler Graphite

50-pound kegs, price per pound.....	\$0.32
100-pound kegs, price per pound.....	.34
Barrels (about 400 pounds), price per pound.....	.20

A very pure and finely powdered graphite forms the base of Mexican Boiler Graphite. When mixed with the feed water it circulates through the boiler and attacks, softens and so disintegrates old scale that it may be easily removed. A graphite finish or polish is imparted to the steel, on which scale will not readily form. In every sense of the word it makes boiler cleaning easy.

U. S. G. Co.'s Mexican Boiler Graphite does all this without harm to the boiler itself, for there is no possible manner in which it could attack the steel of a boiler. On the other hand, boiler compounds of sufficient chemical strength to be efficient, are unsafe because, naturally such chemicals will likewise attack and pit tubes and shells for only very powerful chemical will work effectively on old hard scale. For that reason there is a great advantage in using Mexican Boiler Graphite. It also acts in a manner which is gently mechanical rather than chemically severe. It is effective in any feed water and can not be the cause of foaming. It will not pass from the boiler with the steam and thereby render it unfit for industrial purposes.

No. 205 Lubricating Graphite

No. 205. Graphite is air-floated, of impalpable fineness, pure, soft, peculiarly adhesive and absolutely gritless. It is a sure preventive and cure for hot pins, hot boxes, groaning cylinders, etc., and especially efficient in gas engine cylinders where, besides minimizing carbonization, it assures better compression and power with less gasoline. If judiciously used it will reduce oil and grease consumption at least one-third.

To use, mix thoroughly with oil in proportion of about one teaspoonful to the pint of oil. With greases use about one ounce, or two teaspoonfuls. The dry powder (about one-half

teaspoonful) may be introduced into cold-air intake of carburetor while engine is in motion. It may also be mixed with oil and used as a joint compound for pipes and gaskets.

Wood Grease

For heavy gears of all kinds and especially desirable in the enclosed gears of fast running electric cars. Contains just the right proportion of thoroughly graphitized wood pulp (or fibre) to deaden noise by keeping gear surfaces from coming in direct contact and "grinding," thereby saving gear wear as well as power.

No. 500 Machinery Lubricant

A peculiarly adhesive grease of heavy consistency carrying a large percentage of air-floated lubricating graphite. It is especially efficient for use on cog and sprocket wheels, sprocket chains, transmission cables, wire ropes, hydraulic water pumps, heavy gears, conveyors, elevator slides, etc.

Graphite Cup Grease

Made in four consistencies. **Extra soft.** Suited for rapid running machinery, transmissions and sliding gears. **Soft.** For general use on crank pins, cross heads, valve motions, etc. **Medium.** For use in screw cups or in compression cups. **Hard.** Good stiff consistency for heavy open bearings.

Wiping Waste For All Purposes

Channon Quality Waste is made of soft, absorbent threads, uniformly graded throughout the bales and will be found to give more clean wipes than the usual class of waste.

Owing to the confusion caused by the irregular grading and numbering of waste by some manufacturers, we have discontinued classifying our grades in the White Waste by numbers and have adopted the following classifications and brand names:

Finest Fancy White

For wiping highly polished machinery parts. Is composed of selected, long, soft, well machined cop threads. Is very absorbent, and for the purpose intended there is none better on the market, irrespective of number of grading.

In bales of 125 lbs. Per lb. . . . \$0.33
In bales of 500 lbs. Per lb. . . . \$2.12

"Standard" White

By far our most popular grade of white waste, differs from our finest fancy only in the character of the spinning of the yarn. Fills all requirements of machinery and automobile trade.

In bales of 125 lbs. Per lb. . . . \$0.32 1/2
In bales of 500 lbs. Per lb.32

Wool Waste

Used for all-around journal box-stuffing, for packing and similar use. Our stock at all times runs uniform and is clean and of proper lengths.

We carry two grades only.

Standard Wool Waste

In bales of 125 lbs. Per lb. . . . \$0.32

Skein Wool Waste

In bales of 125 lbs. Per lb.33

Egyptian Polishing

For those desiring the highest grade obtainable of Egyptian cop waste. Is used in large quantities by furniture manufacturers and any who have occasion to use a rubbing or polishing waste.

In bales of 125 lbs. Per lb. . . . \$0.36

"Compo"

Our Compo grade carries all the essential qualities of "Standard" white, with just enough colored stock in it to enable it to be sold at a lower price. It can be used where good quality white waste is essential.

In bales of 125 pounds. Per pound \$0.32
In bales of 500 pounds. Per pound31 1/2

"Excelsior" White Waste

A very popular grade, although intended for more diversified work. Is made from selected threads of good length and is generally satisfactory for shop use.

In bales of 125 pounds. Per pound \$0.31 1/2
In bales of 500 pounds. Per pound31

"Fancy" Colored

Very similar in stock to the "Compo," but containing a greater percentage of colored threads. Very popular with the railroads.

In bales of 125 pounds. Per pound \$0.27
In bales of 500 pounds. Per pound26 1/2

"Number One" Colored

Also very popular with the railroads and for all-around shop use. Stock is of good color and clean. The threads are long, not harsh, and for a colored waste we recommend it highly.

In bales of 125 pounds. Per pound \$0.24
In bales of 500 pounds. Per pound23 1/2

"Number Two" Colored

Necessarily made up of lower grade stock, but for those desiring a cheap waste, we know of no better value obtainable.

In bales of 125 pounds. Per pound \$0.22
In bales of 500 pounds. Per pound21 1/2

Blue White Rubbing Waste

This grade is used by furniture manufacturers for rubbing and polishing purposes.

In bales of 125 pounds. Per pound \$0.35

Individual Bales for Auto Owners and Shops

To meet the demand from individual owners, we are putting up miniature bales of "Finest Fancy," "Standard" and "Excelsior" white waste only. These weigh ten pounds each and are convenient for use in a private garage or in small shops.

Standard white, per bale \$1.75
Excelsior white, per bale1.65

Cotton Rag Wipers

These are put through a steam cleaning and sterilizing process and all objectionable features such as buttons, hooks, eyes, etc., are removed.

White, in 125-pound bales. Per pound \$0.20

White, in 300 and 500-pound bales. Per pound19 1/2

Colored, in 125-pound bales. Per pound16

Colored, in 300 and 500-pound bales. Per pound15 1/2

We also carry in stock in 25 lb. bales our Standard and Excelsior grades of white waste at an advance of 1/2 cent per lb.

H.Channon Company Chicago

Channon Approved Oily Waste Can

Inspected and approved by the Board of Fire Underwriters. Waste cans safeguard your engine-room or shop against spontaneous combustion and other dangerous accidents often caused by oily waste, not properly taken care of. This can is one of the best suited for the purpose of taking care of oily waste, thus avoiding the possibilities of fires, produced by oily waste carelessly thrown in boxes, corners or under benches. This can may save you much money, time and inconvenience and costs very little. They are built of heavy galvanized iron, well constructed and have a simple, self-closing, tight-hinged cover. The cover does not work with springs. The heavy iron legs are securely riveted, raising the body of the can four inches from the floor. Can be furnished in other sizes than stated below on application.

No. 11.	11 $\frac{1}{2}$ x13	inches, capacity 6 gallons.	Price each.....	\$ 4.00
No. 22.	14 $\frac{1}{2}$ x14 $\frac{1}{2}$	inches, capacity 10 gallons.	Price each.....	5.00
No. 33.	16 x17	inches, capacity 14 gallons.	Price each.....	6.50
No. 44.	18 $\frac{1}{2}$ x20 $\frac{1}{2}$	inches, capacity 24 gallons.	Price each.....	9.00
No. 55.	22 x25 $\frac{1}{2}$	inches, capacity 40 gallons.	Price each.....	12.00

Standard Oily Waste Can

No. 2	11 $\frac{1}{2}$ x13 $\frac{1}{2}$	\$2.70
No. 3	14 $\frac{1}{2}$ x14 $\frac{1}{2}$	\$3.50
No. 4	16x17	\$4.70
No. 5	18 $\frac{1}{2}$ x20 $\frac{1}{2}$	\$6.50
No. 6	22x25	\$9.50

Very similar in construction to our approved can above, but it has not been approved by the underwriters. Regular size, 11 $\frac{1}{2}$ x13 $\frac{1}{2}$ inches, and always furnished unless otherwise ordered.

Justrite Oily Waste Can

Approved by Underwriters

Foot lever raises cover, leaving hands free, thus saving time. The cover cannot be left open, which eliminates chances of fire. Lasts a life-time and should appeal to every user of waste.

Made in three sizes.

No. 1.	11 $\frac{1}{2}$ x13 inches.	Each.....	\$5.00
No. 2.	12 $\frac{1}{2}$ x14 inches.	Each.....	5.50
No. 3.	13 $\frac{1}{2}$ x15 inches.	Each.....	6.00

Corrugated Oily Waste Can

Approved by Underwriters

Made of corrugated galvanized iron with four legs and a double opening on top. The corrugated material is much stronger than the plain and is lighter in weight. This can has a double bottom, the seams are riveted and soldered. The covers are self-closing. This is the only can that will nest for shipment, securing third-class shipping rate, instead of first.

No. 1.	15x17 inches, 10 gallons.	\$ 6.00
No. 2.	15x22 inches, 15 gallons.	7.50
No. 3.	15x28 inches, 20 gallons.	8.50
No. 6.	17x28 inches, 25 gallons.	10.00

Peerless Ash Can

A heavy well made can which will outwear the ordinary can by a year or more. Built of good grade of galvanized iron with a heavy steel band at top and bottom, the lower one being riveted through the body and bottom. Concave bottom raised 1 $\frac{1}{4}$ inches from the ground. No. 18 gauge steel shields, closely riveted. Guard drop handles.

This can is also made water tight at same prices.

Made in three sizes.

No.	Size	Capacity, Gals.	Gauge Iron, No.	Price Each
2	14 $\frac{1}{2}$ x24	17	26	\$5.00
3	16 x26	22	26	5.50
4	19 x28	32	24	6.80

Prices include cover.

Similar to Peerless ash can with heavy steel hoop on the top to insure can keeping its shape. The heavy steel hoop at the bottom of body is riveted through to the bottom. Has large malleable guard handles. Bottom set up one inch from ground. The can is heavily riveted throughout. Nos. 5 and 6 can have four heavy staves 5 inches wide riveted to body. Nos. 7 and 8 are without staves.

Made in one size only, 19 inches diameter, 30 inches high, 35 gallons.

No.	Gauge Steel, No.	Price Black	Price Galv.
5	22	\$7.70	\$ 8.80
6	20	8.50	10.00
7	18	8.80	10.00
8	16	10.00	11.00

Above prices do not include covers. Covers extra, \$1.00

"Engineers" Steel Ash Can

Corrugated Ash Cans

Without a doubt the strongest ash can made. The material is extra heavy 24 gauge steel. All side, top and bottom seams are electrically welded. Reinforcing hoops and side handle clips are also electrically welded, making the can practically one piece throughout. The vertical corrugations give triple strength to the sides and insure easy and perfect dumping. The cans are galvanized after formation, thus making leakage impossible. The tight fitting covers prevent the escape of disagreeable odors. Can is raised from ground by means of the bottom hoops of bar steel and insure much longer service. Built in three sizes which are sufficient for any purpose. Covers fit tightly owing to the slightly tapered wide flanges.

No.	Size, Inches	Capacity, Gallons	Price
515	15x26	18	\$6.50
518	18x26	27	7.20
520	20x26	34	8.00

Gasoline or Kerosene Tank

Our 3 in 1 out door above ground storage tank—the most complete oil and gasoline tank ever placed on the market. The cover of the tank is hinged and fitted with hasp and staple, so that it can be locked. Under this is a large funnel built into the tank, which has a very fine filter set into the funnel. Set underneath is an airtight screw cap, which is removable when filling the tank. The conical top sheds all water and when locking the top and the faucet, the gasoline and oil are thief proof. The tank is built of heavy galvanized iron and has a wood bottom. Use of this tank eliminates the necessity of building a house over the storage tank.

Capacity 30 gallons.	Price	\$4.50
Capacity 60 gallons.	Price	6.00
Capacity 110 gallons.	Price	8.50

Wood Jacket Oil Cans

Made for service. The wooden jackets are tightened with welded wire hoops, preventing shrinking or warping. Heavily beaded cone top. All cans carefully tested under pressure.

Intended for use in shipping or handling market oils in small quantities, such as kerosene, black oils, linseed oils, turpentine, etc.

Capacity, gallons.	1	2	3	5	10
With spout, each	\$0.58	\$0.74	\$0.88	\$1.08

H. Channon Company Chicago

Peerless Non-Explosive Can

This can embodies the latest safety improvements for containing explosive and hazardous liquids. It is so constructed that it is easier to fill and gives a more rapid and uniform flow than any other safety can on the market.

The principle governing the non-explosive feature is well known. The can at its opening is fitted with a brass tube, projecting within, through which the liquid flows and the gas, under excessive pressure, can escape. The tube is provided with openings covered with brass wire cloth of close mesh, which does not hinder the flow of the liquid, but through which fire and flame cannot pass. Should the vapor or contents of the can become ignited, the tube prevents the spread of the flame within, confining it to the opening, thereby making explosion impossible. In connection with the tube is a spout with an air pocket to allow a sufficient amount of air to escape while filling and sufficient amount of air to enter the can while emptying it. This permits rapid filling and emptying. The automatic valve, which makes it airtight, prevents evaporation of the liquid.

Delphos Non-Overflow Factory Dispenser

Any can or hand oiler, no matter what size, can be filled with a Delphos dispenser without wasting one drop of oil. With the use of one of these cans the price of wasted oil in any factory will more than cover its cost in a few months. Fills any size metal oiler quickly—pumps any machine, engine or cylinder oil—can be operated in the dark—gurgles when the receptacle is nearly full—overcomes soiling the clothing or hands. No waste possible—never overfills—the spout is a double tube, one an inlet, the other an outlet—oil cannot rise above the mouth of the outlet tube because it siphons back into tank. The three gallon can does not have shelf.

Made in three sizes:

3 gallon capacity, price each	\$ 5.00
5 gallon capacity, price each	6.00
10 gallon capacity, price each	12.00

Walton Oil Tank

Well constructed can for light and heavy oils. Can't overflow. Made of heavy galvanized steel with wood bottom beneath a metal bottom to protect against nails and rust. When the cover is turned back, it provides a shelf for other oils when filling more than one at a time. Neatly painted and stenciled.

Improved Oil Syringes and Grease Guns

Will handle thin or heavy oil or grease equally well. Will suck oil from a drip pan or can. Has two sets of plungers, one for suction and one for force. Simply constructed with nothing to get out of order.

No. 32B. 1 1/4 x 8 inches. Price each.....\$0.20

No. 33A. A grease gun with screw rod having four threads to the inch, allowing quick action. Four-inch straight spout with large opening. Cork plunger and metal handle. Price each.....\$1.40

No. 40. A combination oil and grease gun which can be used for light oil or hard grease. Price each.....\$5.00

Old Method

Lap cement, nails and tin caps.

Fig. 1. Tin caps allow the roofing to buckle at the laps.

Fig. 2. When nails are used without caps, the roofing is bound to tear.

Fig. 3. Illustration shows how a leak could be started by a nail driven into a crack and not holding.

Fig. 4. Showing how a nail may cut the roofing. Often a nail is not driven straight or it bends while being driven.

Boughton Asphalt Roofing

"The Roofing with the Hold-Tite Cleat"

Boughton asphalt roofing is made of high grade wool felt, a tough fabric far better than the cheap "shoddy" substitutes used in ordinary roofings, and is saturated and double coated on both sides with genuine Trinidad Lake asphalt, the greatest weather proofer known. An important feature in the application of Boughton asphalt roofing is our Hold-Tite cleat which is far superior to nails and lap cement, because this cleat grips the roofing so tightly that it can't possibly be blown off by high winds which would ordinarily whip a nailed roof loose. This cleat fastens the laps together with a vise-like grip and makes them absolutely water-tight without the use of sticky lap cement. No sticky hands and sticky tools to work with.

Fully 90 per cent of roofing troubles can be laid to faulty application, and we illustrate below the advantages of our Hold-Tite cleat over the old style lap cement and nails.

New Method Hold-Tite Cleats

Fig. 1. No further use for lap cement or tin caps. Our metal cleat nailed firmly exerts a continuous pressure. With four nails to each joint, an absolutely tight joint is made. If ordinary care is used in the application, nail head cuts, buckled laps and leaks due to drawn nails, are practically impossible.

Fig. 2. If one or two nails do strike a crack or poor spot in the roofing boards, no harm is done, for there will still be two other nails holding the cleat and roofing securely.

Boughton Roofing Prices

Boughton asphalt roofing is furnished in rolls 32 inches wide and either 1, 2 or 3-ply. All plies are packed in rolls containing 108 square feet, enough to fully cover 100 square feet of surface.

We carry in stock Boughton asphalt roofing, with and without Hold-Tite cleats. Prices always include Hold-Tite cleats and nails, or galvanized nails and lap cement.

1-ply. Weight about 3 pounds.
Price per roll, with Hold-Tite cleats \$4.40
Price per roll, without Hold-Tite cleats 3.80

2-ply. Weight about 45 pounds.
Price per roll, with Hold-Tite cleats \$4.90
Price per roll, without Hold-Tite cleats 4.30

3-ply. Weight about 50 pounds.
Price per roll, with Hold-Tite cleats \$5.40
Price per roll, without Hold-Tite cleats 4.80

Boughton asphalt roofing is furnished ready for use. It is not necessary to paint at time of applying. Send for free model of roofing showing the Hold-Tite cleat applied.

Helmer Asphalt Roofing

With Nails and Lap Cement

For those who want a high grade roofing at a low price we recommend our Helmer brand, which is second in quality to our Boughton brand.

It is made of strong, fibrous felt uniformly saturated with a combination of asphalts which is properly processed to withstand the changes of temperature and make a tough but pliable fabric. It is absolutely impervious to all elements by being heavily coated on both sides. The coating on the under side protects against rising steam, vapors, etc., and on the upper side makes a durable wear and weather resisting surface. It will give long service and will not shrink or crack in winter weather, neither will it run during the hottest days nor become dry and hard.

It can be used on all classes of buildings, and makes an air-tight, water-tight, weather-proof roof and meets every requirement of a practical, serviceable roofing material.

Made in 1, 2 and 3-ply, packed in rolls 36 inches wide containing 108 square feet; enough to cover 100 square feet of surface. Large head galvanized nails and lap cement in every roll.

No additional coating is necessary at time of applying except for cementing between laps and painting tops of laps and caps.

Prices

2-ply, weighing about 45 pounds to roll.	Per roll.....	4.00
3-ply, weighing about 55 pounds to roll.	Per roll.....	4.50

Boughton Granite Surfaced Roofing

The manufacturers of this grade were the first to make a stone surfaced prepared roofing. By the use of carefully crushed and screened Wisconsin granite they are able to furnish a roofing with a surface impervious to the wear and tear to which a roofing is subjected. No painting or re-coating is ever necessary. The first coat is the only coat. Does not crack in winter nor does it run, melt or slip in hot weather. Furnished with a standard lap 1/2 inches in width, and put up in rolls containing 108 square feet. Galvanized nails and cement are included in each roll. Weight about 90 pounds.

Price per roll.....\$5.00

Red and Green Rock Surfaced Roofing

The demand for a prepared roofing of a color to please the eye and improve the general effect has, in late years, grown very strong. Our red and green rock surfaced roofing has an excellent appearance beside being heavy, strong, tough and exceptionally durable and lasting. The colors are non-fading and the roof need never be painted.

Furnished in rolls of 108 square feet, weight about 80 pounds. Galvanized nails and cement packed in center of roll.

Price per roll.....\$6.00

Red and Green Rock Surfaced Shingles

There has been a call for a substitute for wood shingles—Why? Because wood shingles are not fire-proof. They are dangerous—they do not last—they are very unsightly after the first year or two.

Our shingles are made of the same materials as the red and green surfaced roofing and are the best quality. They are beautiful in color and do not fade or wash off. Ten years after application the color is the same as when first applied.

They make a perfect roof for public buildings, churches, residences, etc., and all kinds of buildings having a pitched roof. To be laid 4 inches to the weather, 1/2 inch apart. 424 shingles to the square, put up in 4 cartons to the square. These shingles measure 8x12 1/2 inches.

Weight per square, 220 pounds.

Price per square.....\$11.00

Write for sample.

All orders will be given our usual prompt attention.

Boughton Building Paper

felt, about 12 pounds to 100 square feet. Price, per roll.

Specify the weight stock you want—otherwise No. 2 will be shipped.

Boughton Tarred Felt

Made of selected long fibre felt, evenly saturated with distilled coal tar. It is widely used for temporary roofs and siding—keeping out the wind and dampness. Used under weatherboarding and floors to make warmer houses. Suitable for contractors camp houses, tool and supply sheds, to cover fresh cement and brick work.

Comes in rolls of about 55 pounds each, 36 inches wide.

No. 1 Tarred Felt. Heaviest weight made—about 25 pounds to 100 square feet. Used as temporary roofing and sheathing for lumber camps, farm buildings, etc. Price per roll.....\$3.50

No. 2 Tarred Felt. Medium weight—about 16 pounds to 100 square feet. The popular weight for sheathing and roofing purposes. Price per roll.....\$3.50

No. 3 Tarred Felt. A light weight sheathing and roofing.....\$3.50

Boughton Red Rosin Sized Sheathing Paper

Boughton red rosin sized sheathing paper is tough, strong, durable, damp and moisture proof, well calendered, and thoroughly rosin sized. Used largely to make buildings snug, wind tight, and comfortable. It is applied under the siding and saves many times its cost in the fuel bill. Never expose to weather. Supplied in full rolls, containing 500 square feet, and weighing 20, 25, 30, 35 and 40 pounds per roll. Specify the weight stock you want, otherwise we will ship 30 pound weight.

No. 20.	20 pounds to roll, price per roll.....	\$1.60
No. 25.	25 pounds to roll, price per roll.....	2.00
No. 30.	30 pounds to roll, price per roll.....	2.40
No. 35.	35 pounds to roll, price per roll.....	2.80
No. 40.	40 pounds to roll, price per roll.....	3.20

Boughton Deadenning Felt

Boughton Deadenning Felt. Modern buildings require thoroughly sound proof walls and floors. This grade meets this requirement and adds greatly to the warmth of the structure. It is made from selected stock and is free from lumps and all foreign matter. Supplied in rolls 36 inches wide.

No. 1.	1 pound to square yard, about 50 pounds to roll, price per roll.....	\$6.00
No. 1½.	1½ pounds to square yard, about 75 pounds to roll, price per roll.....	9.00

Boughton Slaters' Felt

A light weight tarred paper used under slate, tile, shingles, metal roofs, also for sheathing. Rolls contain 500 square feet, 36 inches wide, weight 35 pounds.

Price per roll.....\$2.50

Boughton Roof Coating

Made especially for coating our Boughton and Helmer Asphalt Roofing, as well as all kinds of prepared roofing. Made in black only.

4-knot.....	30.00	3.00

Roofing Cement

Elastic Roof Cement will repair cracked joints, nail holes, breaks in slate, tile, tin, sheet metal, felt, paper, canvas or composition roofs, also for pointing up foundations and chimneys, sealing up tin flashing, joining broken glass in skylights, sealing up leaks and seams in pumps, tanks, cisterns and silos. Seals cracks and crevices in all building material, adheres to any surface, wet or dry, hot or cold. Will make an absolutely water-tight patch and will not dry out, run or become brittle, but retains its plasticity indefinitely. Furnished in black only.

Tin Caps and Roofing Nails

Tin roofing caps—Each square of roofing requires 1½ pounds of caps.

Wire roofing nails—To be used with tin caps. It requires about 1 pound of 1-inch or 1½ inch nails or about 1½ pounds of 1½-inch nails for each square of roofing.

Large Head Roofing Nails

The required amount is furnished with each roll of roofing. No caps needed. A larger nail 1½ inches long can be furnished if roofing is applied over shingles. 1-inch nails, 180 to the pound. 1½-inch nails, 115 to the pound.

We have a paint for every purpose. See paint section.

Sheet Steel Roofing and Siding

2½ inch Corrugated Sheets

10 Corrugations to Sheet

1¼ inch Corrugated Sheets

20 Corrugations to Sheet

2½-inch Corrugated Sheets are practical for all kinds of buildings such as mill buildings, factories, barns and similar structures; the sheets are easily and quickly applied. The full width of the sheets is 26 inches, covering width 24 inches, which allows a lap of one corrugation. The corrugations measure 2½ inches from center to center and are ½ inch deep. Furnished in painted and galvanized 16 gauge and lighter.

1¼-inch Corrugated Sheets make a very neat appearance and have greater rigidity. Used for roofing, siding and ceiling. For roofing, however, the 2½ corrugation is preferable. If the smaller size is used we recommend a lap of two corrugations to prevent any possible leakage. Full width of sheets is 26 inches, covering width 24 inches, which allows a lap of one corrugation. The corrugations measure 1¼ inches from center to center and are ½ inch deep. Furnished in painted and galvanized No. 20 gauge and lighter.

Regular lengths 5, 6, 7, 8, 9 and 10. The 12 ft. length takes advance of \$0.10 per square. Allow 3 to 6 inches end lap, and 2 to 4 inches projection at the eaves. The selling width of all corrugated sheets is the full width after corrugating. No allowance for laps. This applies to both 2½ and 1¼ inch size.

Prices on all sheet metal roofing quoted upon application.

Two V and Three V Crimped Sheets

This style of roofing has been in use probably longer than any other. The sheets can be nailed to sheathing boards or directly over old shingles without ruining them. In placing the sheets on the roof the crimps shown in the illustration serve to support the joints and brace the sheets firmly, and can be fastened down more securely than any other style of roofing. It is therefore very serviceable in parts of the country where high winds are frequent.

Sheets are 24 inches wide from center to center of outside crimps. Furnished in painted and galvanized No. 20 gauge and lighter. Regular lengths 5, 6, 7, 8, 9 and 10 feet. Sticks for side and center crimps are furnished when ordered. Prices quoted upon application.

Roll and Cap Roofing

Plain Roll Roofing

Roll and Cap roofing.—The distinctive feature of this roofing is that the cap is locked to the cleat, which holds it firmly to the standing seam, making it impossible for the caps to work free, and the cleats being protected from the weather are not liable to rust or loosen. Sheets are 26 inches wide, covering width 24 inches.

Plain Roll Roofing.—Figure A shows cleat as shipped. Figure B. Cleat in position and nailed to sheathing. Figure C. Cleat turned down over the 1½ inch turned-up edge. Figure D. Shows the 1½ inch edge and the cleat folded over the 1 inch turned-up edge. Sheets are 26½ inches wide, covering width 24 inches.

Furnished in painted or galvanized, No. 24 gauge and lighter. Rolls contain 50 lineal feet and will cover 100 square feet.

Pressed Standing Seam Roofing

This style of roofing is highly satisfactory for any roof and is especially desirable for dwelling houses. When used on dwelling houses, we recommend that building paper be used under the sheets, as it not only protects the sheets but also prevents rattling, which is so often objectionable.

The cut illustrates the Pressed Standing Seam which is self capping. Covering width 24 inches. Made in painted or galvanized No. 20 gauge and lighter. Regular lengths, 6, 7, 8, 9 and 10 feet. Can be applied easily and quickly without the use of special tools. Roof pitch should be at least 2 inches to the foot. Prices upon application.

Information regarding application of roofing gladly furnished.

Plain Pressed Brick Siding

Full length of sheets, 60 inches, width 28 inches. Size of brick 2 1/2 x 8 1/2 inches. Furnished in either painted or galvanized No. 24 gauge and lighter.

Rock Face Stone Siding is also furnished in either painted or galvanized No. 24 gauge and lighter. Size of stones 7 x 12 inches. Size sheets 28 x 60.

Beaded Steel Ceiling and Siding

This style is very desirable in stores, warehouses, factories, engine-rooms, boiler-rooms, etc., where it is necessary to have a fireproof and durable ceiling and siding.

Beads are 3 inches from center to center, and sheets cover 24 inches in width after lapping over 1 crimp at the sides of sheets.

Regular lengths 5, 6, 7, 8, 9 and 10 feet. No. 26 gauge and lighter. Made in painted and galvanized.

Steel Ridge Coverings

It is important that sheet metal ridging of some pattern be used for covering ridges of roofs.

Ridge roll cap adds a finished appearance to a building and prevents storms from blowing underneath the steel roofing sheets.

Corrugated Ridge Roll

Plain Ridge Roll

Plain Ridge Capping

Corrugated V Capping

Furnished in painted or galvanized.

Either the plain V ridge cap or the plain ridge roll illustrated above can be used for corrugated steel roofing as effectively as the corrugated ridge, and makes a substantial protector wherever applied.

Barbed Roofing Nails

We furnish nails made especially for roofings in the following sizes: 1 inch, 1 1/4 inch, 1 3/4 inch, 2 inch, either common wire or galvanized.

Weatherboard Siding

Regular lengths 5, 6, 7, 8, 9 and 10 feet. Covering width of sheet 24 inches. Each board measures 4 inches. Finished in either painted or galvanized, No. 24 gauge or lighter.

Lead Washers

Washer No. 8
3/4 in. hole

We strongly recommend the use of lead washers in connection with roofings, as their use makes a water-tight joint, prevents rust and protects sheets from being cut through by the nail head.

Made in 3 sizes, Nos. 1, 2 and 3. No. 2 is the size generally used, 325 to the pound. One pound sufficient for three squares of roofing.

Expanded Metal Lath

Any gauge furnished plain or painted. Number 24 and 26 gauges only furnished galvanized after manufacture. Stock sheets 18 x 96 inches

Roofing and Calking Tools

No. 1 Hoisting Pail No. 1 Dipper No. 1 Mop Pail
All No. 1 dippers and pails are made of double annealed steel with Norway iron trimmings closely riveted. The dipper handle is riveted to a heavy plate and brazed then riveted to body of dipper. The pails are made with the latest approved convex bottom.

No. 1. Hoisting pail, capacity 6 gallons, weight, 9½ pounds. Price each \$8.00

No. 1. Dipper, capacity 1¼ gallons, weight 4¼ pounds. Price each \$5.00

No. 1. Mop pail, capacity 8 gallons, weight 13 pounds. Price each \$9.00

For those desiring a cheaper set of pails and dippers, we recommend our No. 2 grade. These are machine seamed and made of one grade lighter iron.

No. 2. Hoisting pail, capacity 6 gallons, weight 8½ pounds. Price each \$5.50

No. 2. Dipper, capacity 1¼ gallons, weight 4¼ pounds. Price each \$3.20

No. 2. Mop pail, capacity 8 gallons, weight 12 pounds. Price each \$6.00

Carrying and Pay Off Pails

No. 1 Pay Off Pails

Made of heavy black steel. All joints are closely riveted and brazed. The bottom is raised from the floor. Swing handles. The top, bottom and hood are protected with heavy bands. Spouts riveted and brazed. Capacity 4 gallons. Weight 8½ pounds.

Price each \$10.00

Extra spouts, for wood or stone. Weight 1 pound. Price each \$2.00

No. 2 Pay Off Pails

These are made from galvanized sheet stock. All seams riveted and soldered. This is an exceptionally good low price pail. Price includes either flat or round spout. State which is desired when ordering. Capacity 3½ gallons; weight 6½ pounds.

Price each \$6.00

Carrying Pails

Heavy black steel, closely riveted and made with two handles, one swinging. Capacity 5 gallons; weight 8½ pounds.

Price each \$6.00

No. 1 Pouring Cans

Made especially for filling seams in wood or brick pavements. Strongly built of galvanized iron with a cast iron point. It measures 13 inches in length and 7 inches

in diameter. Capacity about 2 gallons. The controlling rod is ½ inch in diameter.

Price each \$3.00

"Channon" Pouring Can is similar to above but lower in price for smaller jobs. Strongly made and will give good service.

Price each \$1.50

Mastic Boilers

This boiler is very substantially made, the material being heavy black steel and all corners being riveted and strongly braced. Provided with special bottoms so constructed that they may be knocked down to clean or for shipping. Provided with sand pockets and extra large fire space. Capacity 100 gallons, weight 450 pounds.

Price each \$120.00

Round Tar and Asphalt Heaters

These heaters are made of heavy black steel and are built in two parts, outside jacket and kettle. They have an exceptionally large fire space and are very quick heaters. Can be furnished in three stock sizes, either with or without sand pockets. Larger sizes can be made on short notice.

1½-barrel capacity (very popular for use on small repair jobs), including tray; weight 110 pounds. Price each \$70.00

Without tray. Price each \$60.00

1½-barrel capacity, without tray. Price each \$90.00

3-barrel capacity, without tray. Price each \$120.00

Sand pockets are extra and will be quoted on application.

Square Asphalt Kettle

This is a very popular kettle especially for large jobs. The fire space runs the full length of the tank, thus insuring perfect and even heating. Made of No. 12 black steel with No. 14 black steel sides. All sides and corners are heavily braced with strong angle iron. Made in three sizes.

Capacity, Barrels	Weight, Pounds	Price Each
1	200	\$ 90.00

3	425	120.00

Sidewalk Calking Furnace

A very handy small furnace for repair work or small jobs. Compartments provided for overalls, tools and oakum and also handle, making it very easy to carry from place to place. Measures 18 inches long, 9 inches wide and 17 inches high. Weight 19 pounds.

Price each \$15.00

Calking Ladle

Capacity 1 qt., 18-in. handle, wt 2 lbs. Price each \$1.00

Roofing Mops

4-ply carpet warp with handle, wt. 2 lbs. Price each \$3.00

Small Wool Pitch Mops

With handle. Price each \$1.00 Price per dozen \$9.00

We can also quote on any other style pails, heaters, etc.

Oakum

All unspun oakum must be spun by hand before it can be used. In some sections, professional calkers insist upon spinning their own, but the demand for machine spun oakum is constantly increasing.

A calker will generally spin about 100 pounds (2 bales) of oakum per day at a cost of from 2½ to 4 cents per pound, depending upon rate of wages. Besides this there is a waste in hand spinning of from 2 to 5 per cent and sometimes more. There is also the loss of time to be taken into consideration.

Machine Spun Oakum is always ready for immediate use—there is no waste and it is evenly spun.

Spun oakum is put up in balls of convenient size and baled in the usual 50-pound bales. These balls unwind from the center like a ball of twine. The thread or spun-yarn can be made to run from 40 to 80 feet to the pound and can be given any practical degree of twist desired.

Creosote Oil

Coal tar creosote oil is recognized everywhere as a wood preservative that has stood the test of time under all conditions. This oil is a pure coal tar distillate, from which all objectionable properties of crude creosote oil have been completely eliminated. The railroad steamship companies have always found creosote oil to be the best wood preservative and they continue to use it to protect their vast properties against decaying bridges, trestles, wharves, docks and trestles. We highly recommend it for use on fences, tanks, walks, silos and windmills.

Price each	.40

Beach Mop Wringer

A good strong and durable mop wringer which will not tear or pull mops apart. Will wring a mop dry and scalding water may be used.

The wringer is built of steel throughout and braced with angle iron.

Price each complete with 14-quart heavy galvanized pail \$6.00

Iron Clad Mop Wringer

The crank mop wringers are built on the principle of the clothes wringer and give a dry mop, at the same time not tearing or pulling the mop to pieces. The wringers have large openings, great leverage and the guards used prevent any slopping of water. The weight of the wringer is carried by the steel frame and not the pail.

The No. 3 wringer as shown in illustration is perfect in construction and built of all steel. The frame work is ¼-inch by ¾-inch steel and has steel swivel castors.

Price each \$5.00

The No. 5 is furnished with a one-inch Georgia pine board platform, otherwise it is the same as the No. 3 Iron Clad.

Price each \$5.00

Challenge

Made with an all steel frame and can be used with almost any pail. Can be furnished with different pails as described below. The galvanized pail is extra heavy and of 14-quart capacity, fastened in a ¼-inch by ¾-inch frame of steel. It never swells or dries out.

No. 1. Wringer	\$3.00
No. 2. With galvanized pail	5.00
No. 3. With three hooped cedar pail	5.00
No. 4. Same as No. 3 but smaller and furnished with a 12-quart pail	4.00

Extra Heavy Challenge

A wood sledged extra large roller wringer with a long leverage, giving an enormous pressure. The simplicity of this three-piece construction with all ½-inch rivets and ¼-inch by 1-inch steel, only brings the total weight to 15 pounds. It is large enough to hold a 20-quart pail.

Price each, without pail \$6.00

Gem Floor Brush

No. 940. Black horse hair, wire drawn, with red polished backs and handles. Prices include handles.

Dry Glues No. 101

Pure Hide Gelatine Flake Glue

Very thin cut and clear. Satisfactory for all work. Serves as an adhesive in fine cabinet making with hard woods. Being free from greases and acids, it makes a splendid casein binder.

Five to 25-pound lots, per pound.....\$1.60

No. 102—Special Cabinet Flake Glue

Made from absolutely pure hide stock, especially for cabinet making and other wood working.

Five to 25-pound lots, per pound.....\$0.90

No. 103—Emery Special Glue

Unexcelled for emery work. Furnished either ground or in flake form.

Five to 25-pound lots, per pound.....\$0.90

No. 104—Ground Sizing Glue

A very satisfactory sizing glue made from bone and animal stock. Used largely for wall and paper sizing and as a binder in the making of casein. Very popular with the book binders and often used in cabinet making with soft woods.

Five to 25-pound lots, per pound.....\$0.44

Special quotations on larger quantities.

Asbestos and Magnesia Products

The loss from radiation and condensation due to uncovered or improperly covered pipes, boilers or furnaces directly affects your pocketbook.

Every dollar wasted in fuel consumption detracts from the earning capacity and profits of your plant. The best insulation is none too good to meet the increasing severity of modern requirements. We have made a study of the insulation problem and are prepared to offer economical suggestions covering individual conditions.

We handle anything made from asbestos and magnesia, and invite your inquiries.

Magnesia Sectional Pipe Covering For High Pressure Steam Pipes

This well-known form of high pressure covering is made of 85 per cent magnesia and combines the high non-conducting qualities of carbonate of magnesia and asbestos in a light, highly efficient insulation.

It is recommended for high pressure and super-heated steam surfaces. Made in sections three feet long. Standard thickness 1 inch.

For list prices see next page.

Wool Felt Sectional Pipe Covering For Cold and Hot Water Pipes

This covering is composed of soft but firm wool felt secured with a heavy interlining of asbestos felt.

For use out of doors and in damp places, a waterproof jacket will be furnished at a slight extra expense.

Made in sections 3 feet long, $\frac{1}{2}$, $\frac{3}{4}$ or 1-inch thick.

For list prices see next page.

Expanded Asbestos Felt Pipe Covering For High and Low Pressure Steam Pipes

This covering is built up of successive laminations of expanded asbestos felt in such a manner that the process fills the covering with dead air spaces, thus forming an extremely effective insulation for high or low pressure surfaces. Is not affected by extreme vibration, and is therefore particularly suited for use on pipes in railway cars, factories, etc.

Made in sections 3 feet long, $\frac{1}{2}$, $\frac{3}{4}$ or 1-inch thick.

For list prices see next page.

"Sweat No" Sectional Pipe Covering To Prevent Pipes from Sweating, Dripping, Etc.

Effectually prevents condensation and dripping on cold water pipe lines. In warm weather condensation from cold water pipes causes considerable trouble and damage to stocks of merchandise in stores as well as to draperies, furnishings, etc., in hotels. Sweat-No covering prevents this by insulating the pipe from the warm air. Will also make pipes frost-proof. Made of wool felt with a waterproof lining on the inside.

In sections three feet long, $\frac{1}{2}$ -inch thick.

For list prices see next page.

Asbestos Air Cell Pipe Covering For Medium and Low Pressure Steam and Hot Water Pipes

The best all around covering manufactured. Is especially adapted for medium and low pressure steam and hot water pipes. 75 per cent of all the pipe covering made and sold is asbestos air cell, thus proving its popularity. No covering on the market can be applied to pipes as quickly or as cheaply as air cell covering. Is very durable and not liable to breakage in shipment or handling.

Made in sections 3 feet long, $\frac{1}{2}$, $\frac{3}{4}$ or 1-inch thick.

For list prices see next page.

"Freeze No" Sectional Pipe Covering For Protecting Water and Gas Pipes from Freezing

This covering prevents freezing of pipes even in zero weather. It is designed specially to resist extreme cold. For use on weather exposed pipes, a water-proof jacket is furnished at slight extra cost.

This covering is composed of solid wool felt $\frac{1}{2}$ -inch thick, lined with $\frac{1}{2}$ -inch of hair felt.

Made in sections three feet long and 1 inch thick.

For list prices see next page.

Asbestos Furnace Cement

For setting up furnaces, ranges, heaters, stoves and repairing broken joints, etc., asbestos furnace cement is most durable and efficient. It adheres firmly to all metals, fire brick, fire boxes, etc. It is absolutely fire-proof and will not crack or shrink away from the iron after being subjected to great heat. This cement is specially adapted for "setting up" furnaces, heaters, etc., and insures a tight joint, thus effectually preventing the escape of smoke and gas.

Asbestos Retort Cement

Asbestos retort cement is used in gas and chemical works for repairing broken clay and iron retorts and cementing pipes, fittings and flange joints; also for cementing joints in metal. It vitrifies without shrinking and is fire and acid proof.

Prices of Asbestos Furnaces and Retort Cements

In 2-pound cans.	Price per can.....	\$0.30
In 5-pound cans.	Price per can.....	.50
In 10-pound cans.	Price per can.....	1.00

In 50-pound pails.	Price per pail.....	3.70

Asbestos Dry Paste

In condensed powder form. Fuller's Asbestos Dry paste solves the problem of paste for heating contractors, manufacturers, mechanics, plumbers and electrical workers.

It is a reliable adhesive paste for pasting asbestos coverings on heating plants. Extreme high temperature will not affect it, so that coverings will not peel off.

It is also unsurpassed for pasting paper, cloth and leather on all kinds of hard, smooth surfaces—glass, iron,

tin, brick, painted and enameled ware.

Can be prepared by simply mixing the powder with cold water. One pound of the powder makes ten pounds, or over a gallon, of smooth, white liquid paste ready for use.

200-pound barrels.	Price per pound	\$0.13

2½-pound cartons.	Price per pound24

Asbestos Corrugated Fire-Proof Paper

For Wrapping Hot Air Pipes, Furnaces, Etc.

A great saving in fuel is effected by the use of Asbestos Air Cell paper as a wrapping around the body of hot air furnaces and pipes. It is also efficient in preventing rust or corrosion when the pipes are not in use. This paper is not expensive and is very easily put on, merely having to be cut the proper length and placed around the furnace or pipes, and wired, and the insulation is complete.

Furnished in rolls 36 inches wide containing 250 square feet each.

List Prices

8	1.30	3.60	4.60	5.20	6.20	3.30

All pipe coverings are supplied in sections 3 feet long, canvased and with bands.

Covering Accessories

We can furnish the following used in connection with our insulation materials.

Rosin sized paper. Twine (sewing and wrapping). Wire (hexagonal, binding, air space and lath). Pipe covering bands, canvas, air space studs, water paste.

Prices upon application.

Asbestos and Magnesia Insulating Cements 85% Magnesia Cement

For high pressure and superheated steam surfaces. Makes a highly efficient insulation for boilers, domes, flues, stacks, pump and engine cylinders.

In 60-pound bags. Price per bag.....\$2.75

Asbestos Magnesia Cement

A special high-grade cement for both high and low-pressure work. In addition to asbestos fibre it contains a large percentage of 85% magnesia which at once assures its efficiency, insulating quality and increased covering capacity. Insulation on the boiler surface is vital to increased radiation on a fuel saving basis.

Do not merely cover your boilers—insulate them with Asbestos Magnesia cement.

In 100-pound bags. Price per bag.....\$2.00

Standard Asbestos Cement

This grade of cement is used for covering and insulating boilers, domes, breechings, house heaters, etc. Composed of asbestos fibre and other fireproof insulating materials compounded to secure efficiency at a low cost. In 100-pound bags. Price per bag.....\$1.20

Directions for Applying Different Grades of Cement

Mix the cement thoroughly with water about the consistency of ordinary mortar. Apply first coat rough about 1/2-inch thick. After it is dry apply second coat to desired thickness and smooth down with trowel. In some cases this is all that is necessary, but to make a durable and efficient covering, especially on vertical boilers and large heated surfaces subject to vibration, it is well to apply over the second coat hexagonal wire. Over this apply the cement troweled to a hard finish to cover the wire and make a smooth surface for painting or canvas jacketing. **Mineral Wool**

Our new process wool is blown by compressed air, hence it is free from sulphur. Is made from magnesia, limestone and other minerals; is fireproof, odorless, free from decay and very efficient in non-conduction.

In bags weighing about 50 pounds, each.....\$3.00

Asbestos Sheet Millboard

This millboard is 98% pure asbestos, and is fire and acid-proof. It is used for fire screens, protecting ceilings and walls exposed to heating apparatus, lining stoves, ovens, fire-boxes, electric insulation, for glass workers use, and many other purposes requiring protection from fire and heat.

Asbestos sheet millboard comes in standard size sheets 40x40 inches. Thicknesses range from 1/8 to 1/2 inch. Furnished in medium and hard quality. Medium regularly furnished.

Approximate Weight per Sheet

1/8-inch thick, 2 lbs. per sheet	3/8-inch thick, 12 lbs. per sheet
1/4-inch thick, 3 lbs. per sheet	1/2-inch thick, 14 lbs. per sheet
3/8-inch thick, 4 lbs. per sheet	3/4-inch thick, 23 lbs. per sheet
1/2-inch thick, 6 lbs. per sheet	1-inch thick, 27 lbs. per sheet
3/4-inch thick, 8 lbs. per sheet	

Full case lots weigh about 300 pounds.

Asbestos Fire-Proof Paper or Roll Board

For lining walls, floors, covering heater pipes and all fireproofing purposes.

This paper is fireproof and especially adapted for use where an extremely efficient non-conductor of heat, cold or sound is required. Its flexibility, its perfect fireproof, vermin-proof and insulating qualities and its very reasonable cost have made it most popular as a fire stop in floors, walls and ceiling. For wrapping heater pipes, lining elevator shafts, etc.

Made in rolls 36 inches wide, weighing about 100 pounds. Furnished in weights of 6, 8, 10, 12, 14, 16 and 32 pounds per 100 feet.

Cordage and Twine for Tying and Sewing

Sisal Cordage

Is made from a fiber grown chiefly in Yucatan and Mexico. This fiber is very much inferior to Manila hemp as to strength, and though made into rope, is used principally for tying.

Sisal Rope

We carry only one grade, which is strictly pure and first quality. Sisal is sold in full coils only of weights given below.

Diameter, inches	1 1/2	2	2 1/2	3	3 1/2	4	4 1/2	5	5 1/2	6	6 1/2	7	7 1/2	8	8 1/2	9	9 1/2	10	10 1/2	11	11 1/2	12	12 1/2	13	13 1/2	14	14 1/2	15	15 1/2	16	16 1/2	17	17 1/2	18	18 1/2	19	19 1/2	20	20 TENTS, CANVAS GOODS AND CAMPERS' SUPPLIES

Something About Tents

Advice Regarding Making a Selection

SELECTING THE TYPE In selecting a tent, one should be guided by the requirements of the party, the method of transportation, the nature of the locality and the season of the year. The Standard Wall Tent with Fly is without question the most popular and widely used tent at the present time. However, where lightness is essential, a single pole tent is preferred by some sportsmen. With this style, the pole may be dispensed with as one can be cut from a neighboring wood each time the tent is erected. For a canoe or walking trip the Sibley, Lumberman's, Wedge or Miner's Tents are recommended. The Family Compartment and Camping Tents are the most suitable for larger parties and are as habitable as a house.

SELECTING THE MATERIAL A tent made of 10 oz. duck means that the duck used weighs 10 ozs. to the yard, and the same with 12 oz., etc. Three kinds of material are used, white duck, khaki duck, and Somerset silk. *U. S. Standard Army Khaki Duck* sheds the water better than white duck and if properly cared for will give better and longer service than any other material. *U. S. Standard Army Duck* is made in strict accordance with the requirements of the United States Government and is the best grade of duck that is used for white tents. *Double Filling Duck* will stand hard wear and rough weather. *Single Filling Duck* is not adapted for hard usage or bad weather, and is not recommended for general use. *Somerset Silk* has the advantage of being very light and a large tent can be rolled into a very compact bundle, which is easy to carry.

WHEN MAKING PRICE COMPARISONS To meet price competition, there are various ways used to cheapen the construction of tents, which are hard for the buyer to detect until the tent is in use. One of the most common methods is to lower the height of the tent from four to eight inches or even more, thus saving considerable material. The pitch of the roof, however, would not be sufficient to shed the rain properly and the tent will leak. The saving effected by the manufacturer is from \$1.00 to \$3.00. Another plan practiced is to substitute 9 oz. duck for 10 oz., 11 oz. for 12 oz., etc., and the saving by this method would amount to \$1.25 to \$3.00 on a regular small size tent. Another point to take into consideration and a very important one is the seams. By skimping them, a considerable saving may be effected. If jute rope is substituted for manila or sisal the cost is still further lowered, but jute rope is utterly worthless after once being wet. This will serve to show you how imperfect a tent may be if the maker wishes to make it.

CHANNON MADE TENTS When a tent is purchased from us, the buyer does so with the distinct understanding that it is without flaws of any kind, and the price will be low as consistent with first quality materials and workmanship. There are no substitutions or improper cutting. We have built up a reputation for making good tents, tents that can be depended upon under the most trying circumstances.

ALLOW SUFFICIENT TIME WHEN ORDERING May, June, July and August are our busiest months. If a tent is needed in May, it should be ordered in April to be on the safe side. Our capacity is large, however, and in most cases we are able to make deliveries in from four to five days' time. It is much better to order early and obviate the chance of disappointment.

Regular Flies which extend 6 inches over the eaves of tents will be furnished without poles at one-half the price of the tent.

If higher walls than list specifies are wanted, add 5% to list for each additional 6 inches. Sod cloths of 8 oz. S. F., 9 inches wide, sewed around the bottom of tent wall at 2 1/2 cents per lineal foot net. Jointed poles uprights, 50 cents for each joint; ridge poles, 75 cents for each joint.

U. S. Army Khaki Duck Tents

Our khaki tents are the highest grade in every respect, being made of the genuine U. S. Army khaki duck, as described on page 6. The khaki color makes them more desirable than the ordinary white tents because it does not absorb the sun's rays as much. It does not attract insects in the same manner and soils less easily.

We pay special attention to finishing these tents in the very finest way. They are fitted with pure manila rope and hand sewed galvanized rings which will not cut or tear the duck. A tent of this kind will give better satisfaction and outwear any other tent made.

Somerset Silk Wall Tents

These so-called silk tents are made of a special fabric woven from the best quality of carefully prepared Sea Island cotton, with silk finish. This material is very light—a little less than half the weight of 8-ounce duck—but closely woven. Tents made of Somerset silk can be packed very small and are ideal for outing where space and light weight are desired; for instance on a canoe trip.

We quote on the following small sizes of wall tents where we know this material is desirable and will prove satisfactory.

Price List of Wall Tents Made of Somerset Silk

Size, Feet	Height of Pole, Feet	Height of Wall, Feet	Price Each	Size, Feet	Height of Pole, Feet	Height of Wall, Feet	Price Each
7 x 7	3	6½	\$21.20	9-4x14	3	7	\$39.00
7 x 9-4	3	6½	25.50	11-8x11-8	3½	8	41.00
9-4x9-4	3	7	30.50	11-8x14	3½	8	46.50
9-4x11-8	3	7	34.50				

Our Prices Include Poles, Stakes and Guy Ropes. Tents Are Packed in Heavy Canvas Bags.

Prices given above are for pole ridges; rope ridges can be furnished at 5 per cent additional cost.

If poles are not wanted we will allow a 5 per cent deduction from the price of an 8 oz. khaki drill tent.

Flies are not included in the above prices, but we will furnish them for one-half the price of tent of corresponding size and weight of duck. Double flies cost same price as tent.

Windows, stovepipe holes and mosquito and fly proof fronts furnished for any of our tents. See pages for prices. If higher walls are desired add 5 per cent for each 6 inches of wall.

Prices on larger sized wall tents quoted on application.

We have a special catalog on tents, canvas goods and campers' supplies. Send for it.

H. Channon Company Chicago

Scout or Shelter Tents

Here's just the tent you want when you go camping or fishing. They are also used for temporary shelter for troops, made in two sections that button together along the ridge pole. One tent affords ample shelter from the damp night air, from rain and wind, for two persons, each soldier carrying one section and one pole; the poles are spliced.

Just the kind of a tent the U. S. soldiers use when they are out in active service. It can be put up or knocked down in a minute. Every boy scout—every boy—who loves outdoor life and adventures should own a shelter tent. Size 5 feet 3 inches long, 3 feet 8 inches wide, 3 feet 9 inches high. Can be sent by parcel post.

No. 1 special white cloth; weight 9 lbs. Each.....\$5.00
No. 2 special khaki cloth; weight 9½ lbs. Each.....6.00

No. 3 yacht drill; weight 10 lbs. Each.....\$7.50
No. 4 khaki drill; weight 11 lbs. Each.....9.50

Channon's Wigwams

A practical wigwam made on the style of the Indian tepee without a center pole, thus affording a large free floor space.

The canvas is supported by a tripod, the poles of which are hinged in the center. Thus the entire outfit can be folded, wrapped in a bundle and carried like a gun.

Each wigwam is decorated in Indian designs, is 7 feet 6 inches high, 7 feet 6 inches in diameter and weighs 12 pounds when packed in canvas bag.

Price of Outfit

No. 1. Extra heavy white drill.....\$ 9.00
No. 2. 8-ounce white duck.....10.00
No. 3. Standard colored drill.....10.00

No. 4 Special for Boys

Made of heavy sheeting and decorated, this wigwam is suitable for boys' play. Is 4 feet high, 5 feet in diameter and weighs 4 pounds packed.

Price, including tripod and canvas.....\$3.00

Miners' Tents

Particularly intended for miners and prospectors, but invaluable to the canoeist and camper who is continually on the move. These tents are very simple and light in weight, and can be conveniently carried as part of a personal outfit. Only one pole is needed for erecting the tent, and the general shape is such that the pitch of the walls allows the canvas to shed water more readily than any other style of tent made.

Canoe or Automobiling Tents

As an aid in the selection of an automobilist or canoeist tent, we have listed on this page a line of tents that may easily be carried on the baggage rack of a touring car or in a canoe, and without being dependent upon a hotel for sleeping accommodations. All the tents listed below are made from a fabric called Somerset silk, which although is light in weight, weighing only 3½ ounces to the yard, is strong and perfectly water and wind proof; it is a light khaki color, absolutely fast, will not fade under any conditions and is less sensible than white to the glare of a strong sun. You can make no mistake in ordering any one of these tents.

Pyramid Without Wall

Pyramid—without wall. These tents are very simple to erect, having only one pole. The pitch of the wall allows the canvas to shed water more readily than any other style of tent made.

Size 7x7 ft., 7 ft. high, weight 5 lbs., each...\$11.80

Size 9x9 ft., 8 ft. high, weight 7 lbs., each...17.80

Size 12x12 ft., 9 ft. high, weight 9 lbs., each...26.00

With spliced center pole \$1.50 extra.

Wedge

Wedge. This is a pattern similar to a wall tent, but without walls, and is widely used by campers, canoeists and those who require a tent that can be quickly erected. The poles may be dispensed with entirely and cut from a convenient thicket at the time of each erection. When poles are not wanted, deduct 5% from the following prices.

Size 5x7 ft., 6 ft. high, weight 5 lbs., each....\$13.80

Size 7x7 ft., 7 ft. high, weight 7 lbs., each....17.20

Size 7x9 ft., 7 ft. high, weight 8 lbs., each....22.50

Size 9x9 ft., 7 ft. high, weight 9 lbs., each....23.40

Rope ridge furnished at an additional cost... 1.00

Pyramid With Wall

Pyramid—with walls. Especially adapted for those who wish a roomy tent at a small cost. It has only one pole and is easy to erect. The walls are 2½ feet high.

Size 7x7 ft., 7 ft. high, weight 6 lbs., each...\$17.00

Size 9x9 ft., 8 ft. high, weight 9 lbs., each...22.80

Size 12x12 ft., 9 ft. high, weight 13 lbs., each...33.50

With spliced center pole \$1.50 extra.

Autocanoe

The large sleeping capacity as compared with the small size when folded makes this a most popular style of tent. Only a single pole is necessary to rig it, and while the size, including stakes, joined pole and ropes is only 42x8 inches when folded, the floor space when set up is 5x7 feet.

Size 5x7 feet, 7 feet high, 2½ foot wall, weight 9 lbs., each\$19.00

Protean

This form of tent is very popular with canoeist as well as with those who wish a tent for automobilizing. It has but one pole and is easily erected. The pole is jointed and when wrapped in the tent makes a small package.

Size, Feet	Height, Feet	Wall, Feet	Weight, Lbs.	Price

Compartment Tents

This is the most desirable tent made for families or large parties. It is divided off into separate rooms, insuring privacy, or the whole may be thrown into a large single tent. We make them both of white and striped duck. The awning is part of the wall, which can be raised on one side of the tent to give shade and free circulation of air. When lowered and secured it is absolute protection against the weather. The partitions for the rooms are of sheeting, same height as the wall, attached to cords stretched from center poles to sides and ends. You can make no mistake in purchasing a compartment tent, as absolute freedom is assured, together with all the comforts of your own home.

Photographers' Tents

The photographers' tents are fitted with single or double skylight openings, extending close to the eaves of the tent, or down the wall, and furnished with flap for a covering when not in use. The greatest care in the manufacture of photographers' tents is necessary. Most tents of this description are made similar to wall tents, and can therefore be sold at wall tent prices. Ours are the result of careful thought and in accordance with the ideas of the most experienced photographers. They embody all the practical details of such a tent, and are the best photographers' tents made at the present time. Particular attention is given to the

finish of the tent, which adds to its attractiveness. Dark room complete with four poles to set up 4½x4½ feet, \$5.00 each. 6x6 feet, \$6.00 each. Additional skylight or sidelight, 75 cents each extra.

Concession Tents

Very practical design for concession men at fairs, carnivals, amusement parks and outdoor occasions.

Can be put up or taken down quickly and easily packed for shipment. Roped on eaves and gables.

Prices include seven foot loose side walls made in two pieces. The back and sides form one piece and the front the other so that it can be taken off easily when not in use. Walls are fitted for snapping or lacing together at the corners as desired. A 14-inch scalloped bound curtain or border goes all around the eave, and for the front we supply a scalloped counter curtain 2 ft. 6 in. high. We do not furnish frames.

Bally-Ho or Counter Curtains

Attractive patterns, red and white and blue and white stripe, with scalloped border. Height 3 feet with rings to attach to Bally-Ho.

Price, per running foot.....\$0.30

Refreshment Tents

With Portable Walls

This style of tent is used at fairs, carnivals and outdoor gatherings for vending purposes. It is very convenient, and when striped duck is used it has a very attractive appearance. You are always assured of the very best when you order tents from us. Our refreshment tents are particularly fine examples of the tent maker's art.

Black Tents

For Moving Picture Work.

Style No. 1

Round end front. Gable end back.

Style No. 2

Hip roof end front. Gable end back.

Style No. 3

Round end front. Hip roof end back.

Style No. 4

Round end front. Back end with two section poles as shown.

For moving picture work our black tents are unsurpassed. We make them of black duck either lined or unlined as may be desired and exercise the greatest care in cutting, sewing and finishing them in order to furnish the strongest and most serviceable tent it is possible to make for show purposes. Every tent is thoroughly roped with pure Manila rope and fitted with a full width plain curtain on the inside and a half width scalloped border on the outside. Sod cloth runs all around bottom of wall.

All sizes up to and including 28x65 are made in any of the styles 1, 2 or 3, but the sizes larger than this are made with two round ends the same as show tents.

We make our black tent linings of either black canton flannel or heavy black drill and sew them securely to the tent. This produces an absolutely dark tent. If lining is desired only for the top or walls and not throughout write us for special prices.

Golf or Canopy Tents

It furnishes shade and as there are no side walls it permits a cool breeze. It is a very desirable tent for golf games, field sports, or lawn use and is much used as a hammock tent, to protect from sun during the day and the dew at evening. We sell a great many for use at outdoor receptions or social gatherings, where a protection from the heat or dampness is absolutely necessary. We make them regularly of white duck, but most people prefer striped canvas. Our list of materials given below for this tent will enable you to select one in exact accordance with your wishes.

Stable Tents

These tents must be practical in every way and as good as any permanent stable for ordinary purposes. They are used mostly in building and construction camps where horses are used and where it is necessary to move frequently. There must be the greatest possible strength in all parts to withstand rough weather and it is on this account and their large size that we put more hand labor into Stable Tents than any other style.

Most tent makers do not reinforce the ridges and eaves, thus making a great saving in the cost of manufacturing such tents. We could do the same and offer them at lower prices, but our long experience has shown us that the greatest strain on these large tents is where the canvas comes in contact with the poles and to give longer life to the tent we know it is necessary to sew on wide heavy bands along the ridge and eaves. In addition to doing this, we rope each tent fully on the ridge, eaves, gables and every nine feet on the top.

Tent Windows

Desirable in large tents for light and ventilation. The opening is filled with fine bobbinet heavily re-enforced and the flap on the outside is made extra large to exclude the wind or rain. The flap can be rolled up and tied as shown or it can be raised or lowered by a cord operated from the inside of the tent.

Net price, complete, put in tent..... **\$1.50**

Asbestos Stove Pipe Shield for Tents

We place stove pipe holes in any tent when wanted. It thoroughly protects the tent from fire or scorching. It is flexible and will roll up snugly. At the opening is placed a wide flap, of the same material as the tent which is rolled up and tied with tapes when pipe is in use. When pipe is not used the flap is lowered and tied in place with tapes, effectually closing the opening and making it water tight.

Price, placed in tent, complete with flap..... **\$2.00**

Ridge Poles

Finished with $\frac{5}{8}$ -inch holes and bands of galvanized iron.

Price per foot

$1\frac{3}{4} \times 2\frac{3}{4}$ in. 6 to 14 ft. long.....	\$0.07
$1\frac{3}{4} \times 2\frac{3}{4}$ in. 14 to 18 ft. long.....	.08
$1\frac{3}{4} \times 3\frac{3}{4}$ in. 18 to 30 ft. long, spliced.....	.10

Preservo

A liquid for waterproofing and making a tent mildew proof. Makes the canvas softer than rubber. It is not affected by heat or cold, acid or alkali. It fills the canvas with a composition that prevents it wearing by friction. Can be applied with a brush, sponge or cloth. One gallon covers 90 square feet. Will not color or stiffen the cloth. Full directions on each can.

Endorsed by all departments of the U. S. Government and used by Barnum & Bailey and Ringling Bros. on all their tents.

1 gallon cans, per gallon.....	\$1.50
5 gallon cans, per gallon.....	1.40
13-in barrels, containing 52 gallons, per gal.	1.25

Steel Tent Stakes

Practically indestructible, made of fine steel and furnished with rings as shown in cut.

9-inch steel stakes, per dozen.....	\$1.15
13-inch steel stakes, per dozen.....	1.40

Wood Tent Stakes

12-inch, per dozen.....	\$0.15

$1\frac{1}{2}$ -inch diameter, 12 to 24 ft. long, per foot.....	.16

Improved Canvas Wheels

No. 50

No. 60

No. 70

No. 80

No. 50 Solid Canvas Wheels are used for polishing plows, stove trimmings, steel tools, and all metals having substantially even or flat surfaces, where fast cutting wheels are required. Used with No. 20 to No. 60 Emery. Made of best grade heavy canvas duck put together with a waterproof cement, making a slightly flexible and resilient surface. Face may be shaped as desired to conform to any special class of work as plowshares, cultivator blades, harrow disks, etc.

No. 60 Loose Canvas Wheels are especially suitable where extraordinary resiliency or pliability is wanted. The wheel is made solid to within one to three inches (or more) from periphery, so that after coating with glue and emery, a yielding cushion is formed easily adapting itself to any shape metal surface to be polished.

No. 70 Stitched Canvas Wheels are made of extra quality canvas duck, lock stitched in circles to periphery. Used for same purposes as solid canvas wheels where more flexibility on yielding face is required.

No. 80 Special Canvas Wheels are particularly recommended for raised stove work, but will be found equally suitable for all polishing work where canvas wheel of extra resiliency of face is required.

Made of heavy cotton duck or canvas belting. The combination of this extra heavy material and our pliable cement makes a wheel with yielding surface, yet one which will hold square face.

Cloth Wheels

These wheels are made of disks of muslin cloth, stitched spirally and cemented to within three inches of periphery. The surface of the wheel being extremely soft and yielding permits the face of the wheel to assume any shape desired and conforms to varying surfaces to be polished. Extensively used by manufacturers of plows, shovels and farm implements for producing finishing polish.

No. 100 Special Buffs

Furnished cut to size, with or without holes, but not glued, made from extra heavy felt canvas; also from old sail canvas, which gives most satisfaction to plow manufacturers, shovel factories and the like.

Price per pound, cut to size, with hole:
Extra heavy new canvas.....\$0.50
Heavy old canvas......40

Old Canvas

Used for Brattice in Mines, Etc.

Usually cut 36, 54, 60 or 72 inches, but we can furnish any width desired. The weight is usually equal to a No. 2 duck. It is clean and odorless and much preferable to the imported brattice cloth, which reeks of fish oil, etc. Per square foot, \$0.05

Filter Cloths

For Potteries, Packing Houses and Paint Manufacturers.

For Gold and Silver Mines.

Any size, style or shape. Usually made of No. 4, 5 or 6 duck with cocoa matting interlining (illustrated), or of plain duck securely stitched with heavy linen thread in transverse seams 1½ to 2 inches apart according to requirements.

Made of light-weight duck, 10 oz. double filling duck being generally used. Made as shown in illustration, or according to your specifications.

Plain White Canvas Paulins

For covering harvesters, binders, threshing machines, stacks, hay, cars, wagons and all kinds of merchandise.

We make paulins for any article and in any size and weight as desired. Below we give a list of the sizes which are most generally asked for.

Plain White Paulins or Stack Covers

Oiled Clothing

Fish and Shield Brand

In every town, big or little, there are farmers, teamsters, and many others whose work keeps them out doors every wet day; and there are those who enjoy hunting, fishing, automobiling, camping and boating. For each of these pursuits a waterproof garment is a necessity, and nothing you can secure will give an amount of service and satisfaction equal to Tower's Fish or Shield Brand.

Souwesters or Waterproof Hats

Tarp

Slicker

Frock or Half Coat

Jacket and Pants

Fish Brand slickers and oiled clothing have been sold to a steadily increasing market since 1836, and have not only met the test of time, but of world-wide service. The sales of the Fish Brand slicker exceed the combined sales of all other waterproof coats. We guarantee every garment bearing the "Sign of the Fish" to give satisfactory wear. Made double throughout, in black and yellow. They are the most durable goods made.

Shield Brand: Goods bearing this trade mark are warranted equal to any in the market, our Fish Brand alone excepted, and are comparable to the best quality only of other manufacturers. Made double throughout, in black and yellow.

Donavin Stoves or Cooking Ranges

For Contractors and
Camping Purposes

Everything Inside Ready
for Use

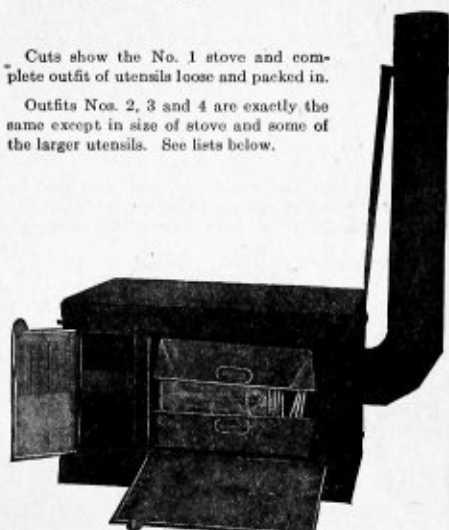

Shipped from Factory,
Columbus, Ohio

Open—Showing Utensils

Cuts show the No. 1 stove and complete outfit of utensils loose and packed in.

Outfits Nos. 2, 3 and 4 are exactly the same except in size of stove and some of the larger utensils. See lists below.

Showing Utensils Packed

No. 1 Outfit

No. 4. Capacity 6 to 18 men. Outside measure 12x13x22 inches. Oven 8x12x12 inches. Weight with utensils, 26 pieces, 72 pounds. Price \$30.00
Price, range, pipe and elbows, only 26.00

No. 3. Capacity 18 to 36 men. Outside measure 15x16x28 inches. Oven 9x15x16 inches. Weight with utensils, 35 pieces, 165 pounds. Price \$60.00
Price, range, pipe and elbows, only 44.00

No. 2. Capacity 36 to 75 men. Outside measure 18x19x33 inches. Oven 11x18x20 inches. Weight with utensils, 35 pieces, 380 pounds. Price \$70.00
Price, range, pipe and elbows, only 61.00

No. 1. Capacity 75 to 125 men. Outside measure 22x23x36 inches. Oven 14x21x23 inches. Weight with utensils, 38 pieces, 380 pounds. Price \$90.00
Price, range, pipe and elbows, only 78.00

All the above are made of malleable iron and steel and are practically unbreakable. These are the most practical ranges for camping parties or contractors' camps. They are carefully made, will cook or bake as well as any stove and the assortments of utensils included in the different sized outfits are the best obtainable.

- 1 Locking bar, flue cleaner, lid
- 1 lifter and poker combined.

Folding Camp Stoves

Made from No. 20 gauge sheet steel, painted with best black graphite, which does not burn or peel off when in use. Every cooking hole on top of stove is protected with a cast iron ring riveted firmly on inside of each hole. The legs are detachable and can be packed inside of stove.

Cooking, Baking and Heating

You can cook, bake, roast, fry, broil and heat no matter what condition of weather. Biscuits can be baked in 15 minutes. They burn anything except coal. Can be used in open air, or in the summer cottage or kitchen, greatly lessen the work of cooking in the camp, and do away with so much annoying smoke and ashes.

Cut showing stove ready for use and folded for traveling

The Little Pet—Folding

The "Little Pet," Folding, size of stove 23 inches long, 12 inches high, 12 inches wide. Size of oven 8x8x12 inches; 48 inches high when standing on its legs. Weight 34 pounds. Has two 5-inch cooking holes and a pipe hole for a 5-inch standard pipe.

Packed in a neat pine box, 4 inches high, 14 inches wide, 27 inches long. Same box can be used for a table in camp.

Price.....\$16.00

Kamp Kook Kit

These kits are well-known for their great strength and utility and will stand the hard knocks of transportation under all conditions, that would put a less well-made outfit out of business.

This complete outfit, consisting of 54 pieces, is a sportsman's size of the Standard U. S. Army "Field Oven" and is the size used by Company Officers' messes. The whole kit nests and packs inside the fire jack. A padlock makes it secure for shipment and the handle on the large boiler furnishes a means of carrying the kit when packed.

The cooking kit weighs 15 pounds, and consists of a wrought iron fire jack, 8-quart heavy steel combined boiler and dish pan, 5-quart heavy steel camp boiler with lifting clips, heavy tin cover; combined frying and baking pan, adjustable wrought handle for pans, 3-quart coffee pot, folding wire broiler and toaster, two heavy wrought retinned ladles, cake turner, basting spoon, flesh fork, can opener, wire ring pot cleaner, dish towel, match box, flour dredge, salt and pepper boxes, and Eldnae candle lantern frame for fluted chimney. The tableware equipment consists of 33 pieces, made up of six steel knives, six forks, six teaspoons, two tablespoons, six open-handle cups, six tin plates, butcher knife in leather case. Whole outfit is thoroughly made and rivets used wherever they will add strength.

The American Litter

Used by the United States Army

A regulation United States Army litter made of heavy No. 10 duck, tan or brown color; 6 feet in length, tacked on handles every inch apart. Size open, 7½ feet long, 21½ inches wide. Folds easily into a space 4 inches by 7½ feet.

The handles are made 2x1½-inch ash, with rounded ends, filled and varnished. Special galvanized steel feet, 1½x¾-inch.

The braces are made of ¾x¼-inch steel galvanized, with painted lugs. Each litter is provided with three leather straps, for folding up, also two blue webbing shoulder straps. Weight 21 pounds.

Price each \$7.00

Double Deck Cot No. 65

This is designed especially for portable houses or for tents, where space will not admit of two cots along side. The combination is made up of one of our house cots and another similar cot about 28 inches above, thoroughly braced and attached to the lower cot. When the lower cot is occupied there is no danger of tipping, and the upper cot, which is only about 40 inches above the floor, is perfectly rigid.

Each cot is 6 feet 6 inches long and 27 inches wide, covered with 12-ounce double filled brown duck, and has a duck fold for a pillow. Both folded together are 6 feet 6 inches long by about 8 inches in diameter, and weigh about 25 pounds.

Price of combination \$4.67

Steel Bunks for Contractors and Campers

The framework is exclusively angle and band steel. In the main frame the fabric is made of heavy wire links with oil-tempered helical springs at each end. The entire construction is such that by removing a few bolts it is knocked down into four parts for shipping. Every logging camp and railroad construction camp should have them.

No. 185. Double-deck bunk. Size 4 ft. 6 in. x 6 ft. 5 in. Weight 190 pounds. Price each \$13.33

No. 185. Double-deck bunk. Size 3 ft. x 6 ft. 5 in. Weight 145 pounds. Price each \$12.00

No. 186. Single-deck bunk. Size 4 ft. 6 in. x 6 ft. 5 in. Weight 105 pounds. Price each \$7.00

No. 186. Single-deck bunk. Size 3 ft. x 6 ft. 5 in. Weight 78 pounds. Price each \$6.33

Cot Mattress

Superior quality cotton felt, covered with an excellent grade of ticking, with slab edges. Made expressly for our folding cots.

No. 1. 2 ft. 6 in. wide, 6 ft. long. Price each \$3.00

No. 2. 3 ft. wide, 6 ft. long. Price each 3.75

Stretcher Bed

We manufacture a special stretcher bed of heavy canvas, either brown or tan color. Size when opened is 3 feet wide and 6 feet long. There are pockets along the sides in which poles are to be inserted and the entire stretcher is supported by stakes driven in the ground at the four corners. In the woods suitable poles and stakes can always be found.

Price of canvas alone, each \$2.25

Folding Camp Chair

No. 3. This chair can be folded and carried as easily as an umbrella. It is extra strong and guaranteed to hold a weight of 300 pounds. It adjusts itself to the body, and is comfortable. Take one of these along with you. Weight 6 pounds.

Each.....\$1.66

No. 4. Same chair as above, with back 6 inches higher. Weight 6½ pounds. Each.\$2.08

Reclining Camp Chair

No. 11

A very comfortable chair, strong and substantially built. Seat covering is of fancy striped duck, double and movable. Frame is of best hardwood and finished in oil. Weight 10 pounds. Each.....\$1.12

No. 11A. Same as No. 11, but with arms and arm rests. Price each.....\$1.40

Folding Lawn Settee

These settees are made of hardwood, spring seat, and are used largely at summer resorts and on lawns. The bodies are finished in vermilion or green and the seats in oil, and the entire settee is covered

with a good coat of varnish. Made in two sizes, viz.:

No. 14. Length 3 feet 6 inches. Weight 16 pounds. Each.....\$2.00

No. 16. Length 6 feet. Weight 26 pounds. Each.....\$2.59

Folding Camp Chairs and Stools

No. 10 Chair

Made of hardwood, birch or rock-elm, nicely finished with filler and varnish, and is a very handsome and good chair in every way. Brussels or velvet carpet seats. An excellent folder, a dozen of them when packed making a very small bundle about 15x26x36 inches, which weighs about 60 pounds. For extras at churches, clubs, opera houses, etc., it has no equal. It is a favorite with undertakers and furniture dealers who rent chairs. Each.....\$1.15

No. 5 Stool

This is the strongest and neatest camp stool manufactured. It folds so compactly that a large number can be packed in a small space. On this account, and because of its small cost, it will be found useful on many occasions. Guaranteed to support 500 pounds.

The seat is 10-ounce brown duck. Weight 3½ pounds. Price each...\$0.50

Folding Slat Seat Chair

The Regulation Folding Chair

No. 2222

Strong and comfortable, adapted for outdoor use. Exposure to weather will not injure it. Made of hard maple, varnished. Weight 7 pounds. Price, each....\$1.00

Pack Sacks

An extremely serviceable pack sack, made of heavy brown Gullwing, a closely woven and waterproof material, especially made for us. Fitted with adjustable shoulder straps and an inside pocket for packing small articles. All parts are heavily sewed and reinforced.

This is the best pack made for medium and heavy carrying.

No.	Size, Ins.	Each
1.	18x16x4	\$3.00
2.	20x16x5	3.50
3.	22x18x6	4.00

With adjustable head strap, 50 cents extra.

Lightweight Pack Sacks

A special light weight sack for carrying small loads. Used on walking trips or in mountain climbing and by women on canoe trips. Made of a fine grade of brown duck, heavily sewed and fitted with adjustable shoulder straps. Made flat, 22x22 inches in size, and will readily conform to the shape of contents. Full capacity about 55 pounds.

Price, complete with head strap.....\$2.75

Heavy Pack Harness

Showing heavy pack harness loaded with a 14x16-foot wall tent packed in an 18x36-inch duffel bag. The straps are of the finest leather, securely riveted and sewed to the shoulder yoke. Made throughout of heavy brown canvas, double thickness. It is readily adapted to all sizes and shapes of packs.

Price of harness only, complete with shoulder and breast straps.....\$3.50

Food Bags

The most convenient method of carrying sugar, coffee, salt, rice, beans, oatmeal, etc., in pack sacks, as they are of no particular shape and can be packed in anywhere.

Eight to ten of the 5-pound size can be packed in one of our light weight pack sacks.

Made in any size to order, of the best canvas, with string lacing at top. When closely tied up, the contents are proof against moisture and insects.

We have three sizes in stock:

5-lb. size or less, per doz.	\$2.75
10-lb. size or less, per doz.	3.50
10-lb. size, extra heavy, doz.	4.00

Dunnage Bags

These bags are very handy where there is a large equipment. Made 45 inches long, of light or heavy duck.

8-oz. duck, dozen	\$ 9.75
12-oz. duck, dozen	13.35

Waterproof Duffel Bag

Made of a special brown waterproofed canvas with heavy seams and a double top. Both the inside and outside tops can be closed tightly with cords. The smaller bags are just the thing for provisions and general camp supplies and the larger sizes are suitable for packing tents.

We fit each duffel bag with handles at the side and bottom to add to their portability. With these handles on the bag no special harness is necessary for carrying them on the shoulders. An additional advantage of a duffel bag such as we make is that any goods packed therein are accepted anywhere as baggage.

Channon's Gasfitters Bag—No. 50

Extra heavy
brown duck with
stiff leather bot-
tom.

Lined with brown canvas. Five metal studs on bottom.
Strong leather shoulder strap fastened to frame with nickel-
plated rings. Leather handles and center strap passing around
bag to keep it in shape when loaded. 18 in. long, 12 in. high,
8 in. wide.
Each..... \$3.50

Channon's New Tool Bag

For Electricians, Linemen, Gasfitters and Plumbers

Selected grain leather. Heavy
water-proof binder's board reinforces
the bottom, which is protected by
eight metal studs.

The flap or cover is a continuation
of one side of the bag and fastens in
front with three one-inch leather
straps and buckles. Shoulder strap is
connected to bag by plated snaps and
rings.

All edges and bottom are piped and
sewed on a lock stitch machine. The
bag cannot rip open unless every
thread is cut.

19 in. long, 8½ in. wide, 10 in. deep.
Each..... \$6.50

Channon Plumbers' Tool Roll—No. 60

Used by plumbers and steamfitters. Extra heavy white duck
entirely bound with leather. Pockets are of same material,
riveted at the top by double-headed japanned rivets and sewed
with heavy carpet thread. Has thirty assorted size pockets.
Two russet leather straps 1 inch wide passing through leather
stays. Extra heavy reinforced leather handle. Size, 56 in.
long, 24 in. wide.
Per dozen..... \$37.00

Coal Bags

Channon's Coal Bag No. 217

One of the
most durable
bags we manu-
facture.

The handles are reinforced and extend clear around the bag.
Bag has handles set low on the sides to make it easy to empty.
This is a feature worth considering. The bag is made of No. 4
duck, double bottom of 12-oz. double filled duck. Strongly
sewn and reinforced at the corners.

No. 217. Price per dozen..... \$13.33

Channon's Coal Bag No. 216

Made of No. 4 duck,
finished with canvas
handles extending
about six inches down
the side.

No. 216. Price per dozen..... \$10.00

Channon's Coal Bag No. 218

An unusually
durable bag.
Made of No. 4
duck with rein-
forced handles,
extending com-
pletely around
the bag to re-
sist strain from
rough handling.
Price per
dozen, \$11.50

Carroll Adjustable Awnings

Any awning will fit a window two inches wider or two inches narrower than the size it is made by spreading or contracting the arms where they fasten to the building, so that by making three sizes we can fit all ordinary windows.

Carroll Adjustable Window Awnings are made in three sizes, each size fitting three different widths of windows, and are made exactly like all high priced awnings.

Made in three sizes, 8-oz. Duplex duck, blue and white, or brown and white, complete with pulleys, ropes, cleat, galvanized fixtures, screws, staples, etc., and full directions for hanging.

Height, 42 inches; projection, 30 inches. Price per dozen \$24.00

No. 1 fits windows 2 feet 4 inches, 2 feet 6 inches and 2 feet 8 inches wide.

No. 2 fits windows 2 feet 10 inches, 3 feet and 3 feet 2 inches wide.

No. 3 fits windows 3 feet 4 inches, 3 feet 6 inches and 3 feet 8 inches wide.

Unless otherwise ordered, we pack six No. 1, four No. 2 and two No. 3 in each bale.

Each awning wrapped separately. Shipping weight, 80 pounds per dozen.

Bieder Adjustable Door Awnings

Are made adjustable the same as Bieder Adjustable Window Awnings, and fit all size doors from 4 feet to 6 feet wide. They are made of the same duck as the window awnings, and adjust in the same manner.

To not interfere with screen doors (which swing out) they are made large enough to fasten about two feet above top of door, and with enough extension to allow door to open out without touching them and wide enough to fasten outside of the door frame.

No. 4 Bieder Adjustable Door Awning, 8-oz. Duplex duck, blue and white, or brown and white, adjustable frame, galvanized fittings, widths adjustable from 4 feet to 6 feet, length 60 inches, projection 50 inches, complete with pulleys, rope, cleat, staples, screws, etc., and full directions for hanging. Each awning wrapped in cloth. Price per dozen \$72.00

Packed one-half dozen in bale. Shipping weight, 50 pounds per bale (½ doz.).

Bieder Adjustable Porch Curtains

Are made adjustable in the same manner as the Bieder Adjustable Window Awnings, and of the same material.

They are made in three sizes, are easily adjusted, easy to hang and will fit any porch.

They add much to the comfort and seclusion of the home.

Eight-oz. Duplex, blue and white, or brown and white, adjustable frame, complete with pulleys, ropes, cleat, screws, galvanized fixtures, and full directions for hanging.

No. 5 Adjustable, 4 ft. to 6 ft. wide, 76 in. high..... \$48.00

No. 6 Adjustable, 6 ft. to 8 ft. wide, 76 in. high..... 60.00

No. 7 Adjustable, 8 ft. to 10 ft. wide, 76 in. high..... 72.00

Shipping weights: No. 5, 60 pounds per dozen. No. 6, 90 pounds per dozen. No. 7, 120 pounds per dozen.

Each curtain wrapped separately.

Canvas Aprons

Made of White or Brown Duck

Made of heavy white or brown duck. Long pattern, to reach below the knees. Large pocket on front, adjustable neck supporters. Mechanics' are divided so as not to interfere with walking.

	Carpenter	Per Doz.
No. 3. 8-oz. brown duck.....		\$3.60

United States Flags

All our flags are made of genuine wool bunting as made for by U. S. Government specifications. They are properly sewed and finished throughout in a first-class manner. We guarantee the workmanship to be unexcelled. The small sizes have canvas headings and brass grommets, but the larger sizes, from 15x10 feet upwards, have strong canvas headings with manila ropes inserted. We sew a full complement of stars on each union, except on the 3 and 4-foot sizes, which have but thirteen stars.

Our flag manufacturing department is the largest in the country, and we take special pride in the quality of work turned out. Channon flags can be found on all the school houses and public buildings in the country.

Steel Flag Poles

Re-Mov-Able

The poles that are 20 feet and 25 feet above ground are made in two sections and the 30-foot, 35-foot and 40-foot in three sections, besides the sockets. The sections fit into each other, making a gradual taper.

The lower half of the pole is filled with concrete which adds very materially to the strength.

These steel poles are superior to wooden poles for the following reasons: They will not rot and will last indefinitely—they can be taken to pieces and housed—no holes have to be dug, as the sockets are driven into the ground—they are also ornamental.

The prices which include all the fittings and halyards are much lower than wooden poles and are as follows:

20-foot.....	\$12.50	35-foot.....	\$31.50
25-foot.....	16.00	40-foot.....	24.50
30-foot.....	18.50

Channon Feed Bags

We are the largest manufacturers of feed bags in the country, and show herewith the styles we have found from our long experience to be the strongest and most satisfactory bags for all around use. These are the popular bags with the dealers because most easily saleable.

No. 1

A first-class cheap bag. Made of heavy 12-oz. duck wired onto a carefully selected hardwood bottom. Rope head strap. Price per dozen.....\$4.00

No. 2

Our most popular seller. Heavy 12-oz. duck top. Large leather bottom and ventilator. Four-foot head strap. Price per dozen.....\$8.40

No. 5

Harness leather throughout. The strongest feed bag made. Special No. 8 duck top. Extra large leather bottom and half leather body as shown in cut. Four-foot leather head-strap. Heavily sewed and riveted. For those who want the best. Price per dozen.....\$18.25

No. 6

Heavy No. 6 duck top, 16 in. deep and 18 in. across opening when laid out flat. 4 1/2-foot head-strap made of 1-in. leather. Oval bottom 8x10 inches. Made of best leather. Large leather ventilator. Price per dozen.....\$15.25

No. 7

While this bag is similar to our No. 2 style, it is better and stronger in every way. The top, which is cut larger to make it suitable for large horses, is made of genuine 12-oz. double-filling duck. Leather bottom, ventilator and 4-foot head-strap. The most serviceable all-around feed bag on the market today. Price per dozen.....\$8.75

Coal Bag, Style 18

Coal bag style, 18 inches wide by 17 inches deep. Made of 12-oz. double-filling duck, with double bottom, adjustable canvas head-strap, heavily sewed and riveted throughout. A light bag, strong and durable. Price per dozen.....\$14.00

No. 8

Harness leather throughout. Special quarter leather body, adding greatly to the strength and durability of the top, which is made of No. 8 duck. This 4-inch strip of leather, heavily sewed onto the canvas top and riveted to the leather bottom, reinforces the bag where it is necessary and prolongs the life of the bag 100 per cent. Large leather ventilator and head-strap. Price per dozen.....\$14.50

Boy Scouts' Pocket Knife and Tool Kit

Pocket book, knife, reamer, file, saw, chisel, screwdriver, cork puller. All 8 in 1, each tool firmly attached or detached to knife in a second.

Always at hand for immediate use, whether camping, boating, teaming, driving, in the shop, factory, office, store, warehouse, automobile, on the farm, bicycle or around the home.

Price \$2.25

Scout's Axe

The New Official Axe of the Boy Scouts

Larger size officially adopted. Weight, with handle, 1 pound 5 ounces.

Solid steel of special analysis, from head to cutting edge. Double tempered, making a good keen edge. Hard, yet tough.

Highest grade hickory handles, with special forest finish.

Sheath of heavy russet leather.

The handiest tool in a woodsman's kit.

Without sheath. Price each \$1.50

With new heavier sheath. Price each 2.00

Hunters' Hatchets or Axes

A good axe is one of the main requisites of a good camp, and care should be exercised in its selection. We have given a great deal of attention to our axes, and those we offer cannot be improved on for quality.

No. 1. Bright, polished bit, 12-inch handle, natural finish, weight 1 1/4 pounds. Price each \$1.50

No. 2. Bright, polished bit, 14-inch handle, natural finish, weight 1 3/4 pounds. Price each \$1.75

The Channon Collapsible Pail

Open, with Spout

These pails are carefully constructed in our own canvas factory of an especially prepared duck.

The pail is firmly shaped, by heavy wire rings, making it very strong and serviceable. A wire bail is securely fastened to the top ring and finished with a wooden handle. Furnished with or without spouts.

Just the thing for the practical automobilists or launch owner.

Size 6 quarts, without spout. Price per dozen \$ 7.00

Size 10 quarts, without spout. Price per dozen 8.00

Size 6 quarts, with spout. Price per dozen 9.00

Size 10 quarts, with spout. Price per dozen 10.00

Open, without Spout

For Auto-
mobilists
and
Launch
Owners

Megaphones

Few people are fully acquainted with the many uses of the megaphone. The U. S. Navy, the large steamships and tug boats; all classes of yachts and sailing vessels, as well as many railroads, race tracks, golf clubs, etc., are using them in large numbers. The small megaphone or "Hurrah Phone" is a favorite among college and school boys for cheering on their men in athletic meets or foot ball and base ball teams. They increase the volume of sound to such an extent that a small body of students armed with them can drown the shouts of four times their number without.

Plain Strap Handles

Plain mouth piece—no hoops.

H. Channon Company Chicago

Freight Classifications (L. C. L.)

Copyrighted by H. Channon Company

On traffic originating in Chicago, the U. S. is divided into four general classification territories, viz.: Eastern or Official, Southern, Western and Illinois, designated below as E, S, W and I.

Eastern Territory includes all states east of Lake Michigan and Illinois and north of the Ohio River, including West Virginia and points on and north of the S. & W. Ry. in Virginia—embracing all the Central, North Atlantic and New England States and Eastern Canada. Also applies to Louisville, Henderson and Owensboro, Ky., Bristol, Tenn., points on the C. & O. in Kentucky and the eastern portion of the North Peninsula of Michigan and all Virginian Ry. stations.

Southern Territory includes all states south of the Ohio River and points south of the N. & W. Ry. in Virginia, except as provided in Eastern Classification. Also applies to points on west bank of Mississippi River from Helena, Ark., to New Orleans.

Western Territory includes Wisconsin, the Northern Peninsula of Michigan, Minnesota and all points west of the Mississippi River excepting as otherwise provided under the Southern and Illinois Classification.

Illinois Classification Territory includes the state of Illinois, and points on the west bank of the Mississippi River from St. Louis, Mo., to Dubuque, Iowa, inclusive.

Explanation of Characters used below:—

1 = First Class. 2 = Second Class. 3 = Third Class. 4 = Fourth Class. 5 = Fifth Class. 6 = Sixth Class.
 1½ = 1½ times 1st Class. D1 = Double 1st Class. 2½ = 2½ times 1st Class. 3-1 = 3 times 1st Class. L. C. L. = Less than carload.
 A = Class A, W and S. B = Class B, W. only. C = Class C, W. only. R25 = Rule 25, E. Classification only = 15% less than 2nd Class. K. D. = Knocked down. S. U. = Set up.
 N. O. S. = Not otherwise specified.

L. C. L. Freight Rates (per 100 lbs.)

On goods shipped from Chicago to a number of towns in each state. Other towns located in same part of the state take practically the same rate or only a few cents per 100 pounds more or less.

First, refer to Classification Tables to arrive at the proper class to which the goods belong, then locate the proper rate per 100 pounds in the table of rates following. Shipments of less than 100 pounds usually charged as 100 pounds at 1st Class rate. Rates given subject to changes.

Map of Chicago's Package Car Scheme

Showing the number of days it takes less than car lot shipments to reach various points throughout the country.

Prepared and published by the Chicago Association of Commerce to illustrate the system and scope of

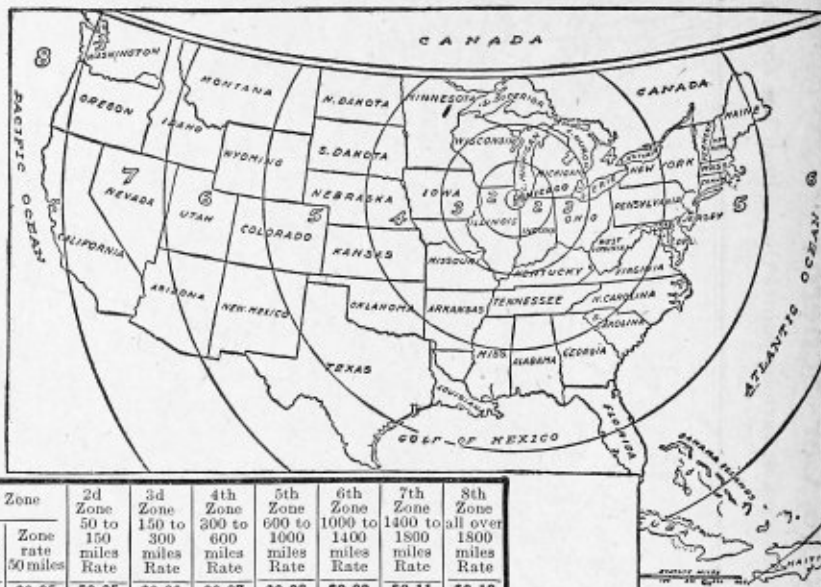

Chicago's Unrivalled Merchandise Service

(For less car lot freight shipments)
The figures within the circles indicate the number of days required to reach each point.

Parcel Post Zones and Postage Rates From Chicago

Parcels weighing four ounces or less are available at the rate of one cent for each ounce or fraction of an ounce, regardless of distance.

Parcels weighing more than four ounces are available at the pound rates shown in the following table, a fraction of a pound being considered a full pound:

WEIGHT	First Zone		2d Zone	3d Zone	4th Zone	5th Zone	6th Zone	7th Zone	8th Zone
	Local rate*	Zone rate 50 miles	50 to 150 miles Rate	150 to 300 miles Rate	300 to 600 miles Rate	600 to 1000 miles Rate	1000 to 1400 miles Rate	1400 to 1800 miles Rate	all over 1800 miles Rate

*The rate for local delivery shall apply to all parcels mailed at a post office from which a rural route starts, for delivery on such route, or mailed at any point on such route for delivery at any other point thereon, or at the office from which the route starts, or on any rural route starting therefrom, and on all matter mailed at a city carrier office, or at a point within its delivery limits, for delivery by carriers from that office, or at any office for local delivery.

Domestic Parcel Post, Limit of Weight

Limit of weight of delivery within the first and second zones, 50 pounds; to all other zones, 20 pounds.

Dimensions Limit of Parcels and Restrictions as to Character of Contents

Parcels must not be greater in size than 84 inches in length and girth combined nor in form or kind likely to injure the person or any postal employee or damage the mail equipment or other mail matter and not of a character perishable within a period reasonably required for transportation and delivery.

Stove casings and pieces of machinery should be protected with excelsior or similar material and wrapped in cloth or strong paper or be properly boxed or crated.

Sharp-pointed or sharp-edged instruments or tools must have their points and edges protected so that they cannot cut through their covering, and be thoroughly wrapped.

Powders and all pulverized dry substances must be so wrapped that none of the contents of the package will sift out.

Books may now be sent by parcel post.

The following may not be sent: Intoxicating liquors, poisons, matches, explosives, fire-arms, benzine, caps, cartridges, gun-powder and inflammables.

To find the size limit: Take a piece of string 84 inches long and wind it once completely around the parcel and then across the top lengthways. If the ends of the string reach the sides of the parcel it comes under the limit.

Regular carriers will deliver parcels wherever possible.

Parcels must be mailed at the postoffice or branches and regular stamps may be used.

Express Rates

Express rates per 100 pounds on goods shipped from Chicago to cities in each State, these cities being used as a basis for figuring rates for all the towns in the immediate vicinity of each city. Express Agent will give you the exact rates from Chicago to your town and full information about their delivery service.

Useful Information

Steam

A cubic inch of water evaporated under atmospheric pressure is approximately converted into 1 cubic foot of steam.

The horse-power of boilers, as per standard adopted by the Am. S. M. E., is 30 pounds water evaporated per hour at a pressure of 70 pounds per square inch and from a temperature of 100 degrees Fahr.

Well designed boilers, under successful operation, will evaporate from 7 to 10 pounds of water per pound of first-class coal.

Each square foot of heating surface is considered sufficient to evaporate 2 pounds of water; therefore, for an engine using 30 pounds of water per horse-power per hour, each horse-power of the engine requires 15 square feet heating surface in the boiler.

On one square foot of fire grate can be burned on an average from 10 to 12 pounds hard coal, or 18 to 20 pounds soft coal, per hour, with natural draft.

Two and one-quarter pounds of dry wood is equal to 1 pound of average quality soft coal.

Steam engines consume from 12 to 50 pounds of feed water, and from $1\frac{1}{4}$ to 7 pounds of coal, per hour per indicated horse-power.

Condensing engines require from 20 to 30 times the amount of feed water for condensing purposes; approximately for most engines, 1 to $1\frac{1}{2}$ gallons condensing water per minute per indicated horse-power.

Water

One cubic inch weighs .0361 pounds.

One pound = 27.7 cubic inches.

One cubic foot = 62.4245 pounds at 39 degrees Fahr.; 7.48 gallons U. S.; 6.2321 gallons imperial.

One gallon U. S. = 8.33111 pounds; 231 cubic inches; .13368 cubic feet.

One imperial gallon = 10 pounds at 62 degrees Fahr.; 277.274 cubic inches; .16046 cubic feet.

One pound pressure = 2.31 feet in height.

One foot in height = .433 pounds pressure.

Petroleum weighs $6\frac{1}{2}$ pounds per U. S. gallon, 42 gallons to the barrel.

To convert imperial gallons into U. S. gallons, multiply by the factor 1.2. To convert U. S. gallons into imperial gallons, multiply by the factor .8333.

A *miner's inch* is a measure for flow of water, and is the quantity of water that will flow in one minute through an opening 1 inch square in a plank 2 inches thick under a head of $6\frac{1}{2}$ inches to the centre of the orifice. This is equivalent, approximately, to 1.53 cubic feet, or $11\frac{1}{2}$ gallons per minute.

To find the diameter of pump plungers to pump a given quantity of water at 100 feet piston speed per minute, divide the number of gallons by 4, then extract the square root, and the result will be the diameter in inches of the plungers.

To find the number of gallons delivered per minute by a single double-acting pump at 100 feet piston speed per minute, square the diameters of the plungers, then multiply by 4.

To find the horse-power necessary to elevate water to a given height, multiply the weight of the water elevated per minute by the height in feet and divide the product by 33,000 (an allowance should be made for water friction and a further allowance for losses in the steam cylinder, say from 20 to 30 per cent.).

The mean pressure of the atmosphere is usually estimated at 14.7 pounds per square inch, so that with a perfect vacuum it will sustain a column of mercury 29.9 inches, or a column of water 33.9 feet high at sea level.

To determine the proportion between the steam and pump cylinder, multiply the given area of the pump cylinder by the resistance on the pump in pounds per square inch, and divide the product by the available pressure of steam in pounds per square inch. The product equals the area of the steam cylinder. To this must be added an extra area to overcome the friction, which is usually taken at 25 per cent.

The resistance of friction in the flow of water through pipes of uniform diameter is independent of the pressure and increases directly as the length and the square of the velocity of the flow, and inversely as the diameter of the pipe. With wooden pipes the friction is 1.75 times greater than in metallic. Doubling the diameter increases the capacity four times.

To determine the velocity in feet per minute necessary to discharge a given volume of water in a given time, multiply the number of cubic feet of water by 144 and divide the product by the area of the pipe in inches.

To determine the area of a required pipe, the volume and velocity of water being given, multiply the number of cubic feet of water by 144 and divide the product by the velocity in feet per minute.

Pressure of Water

The pressure of water in pounds per square inch for every foot in height to 260 feet: and then, by intervals, to 3,000 feet head. By this table, from the pounds pressure per square inch, the feet head is readily obtained, and *vice versa*.

Feet Head	Pressure per Square Inch	Feet Head	Pressure per Square Inch	Feet Head	Pressure per Square Inch	Feet Head	Pressure per Square Inch	Feet Head	Pressure per Square Inch	Feet Head	Pressure per Square Inch

Useful Information.

Table of Capacity of Pumps

The figures at the extreme left of the table are piston or plunger diameters; the line of figures across the top are piston or plunger strokes; the figures in the body of the table are the capacity or displacement in gallons, corresponding to a single stroke. To find the capacity for one revolution multiply the capacity for a single stroke by two.

Diameter of Cylinder, Inches	LENGTH OF STROKE IN INCHES

Contents of Cylinders, in Cubic Feet, and in U. S. Gallons for One Foot of Length

231 Cubic Inches Equals One Gallon, and 7.4805 Gallons Equals One Cubic Foot

For the contents of a greater diameter than any in the table, take the quantity opposite one half said diameter, and multiply it by 4. Thus the number of cubic feet in one foot length of a pipe 80 inches in diameter, is equal to $8.728 \times 4 = 34.912$ cubic feet. So also with gallons and areas.

Fire Streams

John R. Freeman, M. E.

Pressures required at nozzle and at pump, with quantity and pressure of water necessary to throw water various distances through different-sized nozzles—using 100 feet of $2\frac{1}{2}$ -inch rubber hose and smooth nozzles.

	Size of Nozzles

*For greater lengths of $2\frac{1}{2}$ -inch hose, the increased friction can readily be obtained by noting the differences between the "pressure at nozzle" and the "pressure at pump or hydrant," as given above. For instance, if it requires at hydrant or pump 10 pounds more pressure than it does at nozzle to overcome the friction when pumping through 100 feet of $2\frac{1}{2}$ -inch hose (using 1-inch nozzle, with 40 pounds pressure at nozzle), then it requires 20 pounds pressure to overcome the friction in forcing through 200 feet of same size hose.

The heights and distances given for good "effective fire streams" are with moderate wind. The maximum vertical height reached by the spray or drops in still air, is from 22 per cent for the lower pressure, to 56 per cent for the higher pressures, greater than the elevations as given in the table above. The maximum horizontal distance reached by the spray or drops in still air is about 120 per cent for the lower pressures and 150 per cent for the higher pressures, greater than the distance given in the table.

Two hundred and fifty gallons per minute is considered a good "standard fire stream," with 80 pounds pressure at the pump or hydrant.

Weight and Capacity of Different Standard Gallons of Water

	Cubic inches in a Gallon	Weight of a Gallon in Pounds	Gallons in a Cubic Foot	Weight of a Cubic foot of Water English Standard 62.531 lbs. Avoirdupois.
Imperial or English.....	277.274	10.00000	6.232102	
United States.....	231.000	8.33333	7.480519	

Weight of crude petroleum, $6\frac{1}{2}$ pounds per United States gallon, 42 gallons to the barrel.

Weight of refined petroleum, $6\frac{1}{2}$ pounds per United States gallon, 42 gallons to the barrel.

A "miner's inch" of water is approximately equal to a supply of 12 United States gallons per minute.

Theoretical Flow of Water Through Nozzles

(Joshua Hendy Iron Works)

As an example of the use of these rock-drill tables, we may assume that an outfit of ten 3-inch drills is projected at an altitude of 9,000 feet, and that it is proposed to carry 70 pounds pressure at the drills. The compressor displacement suitable for such a plant is required.

From table above we find that one 3-inch drill at sea-level uses at 70 pounds pressure the equivalent of 105 cubic feet per minute of free air. The factor of multiplication for 10 drills at 9,000 feet altitude is figured as 9.9. Multiplying 105 by 9.9 gives 1039.5 cubic feet per minute as the displacement of a compressor suitable, under average conditions, for such a plant.

Volume of Free Air Required for Operating Hoisting Engines

In the table, the hoisting engine is assumed to actually run but one-half of the time for hoisting, while the compressor, of course, runs continuously. If the engine runs less than one-half the time, as it usually does, the volume of air required will be proportionately less, and vice versa. The table is computed for maximum loads, which also in practice may vary widely. From the intermittent character of the work of a hoisting engine the parts are able to resume their normal temperature between the hoists, and there is little probability of the annoyance of freezing up the exhaust passages.

The Air Compressed to 60 Pounds Gauge Pressure. Double Cylinder Engines

Diameter of Cylinder Inches	Stroke, Inches	R. P. M.	Normal Horsepower	Actual Horsepower	Weight Lifted Single Rope	Cubic Feet of Free Air Required
5	6	200	6	11.8	1000	150
5	8	160	8	12.6	1650	160
6 $\frac{1}{4}$	8	160	12	19.8	2500	250
7	10	125	20	24.2	3500	302
8 $\frac{1}{2}$	10	125	30	33.6	6000	340
8 $\frac{3}{4}$	12	110	40	37.8	8000	476
10	12	110	50	52.4	10000	660
12 $\frac{1}{4}$	15	100	75	89.2	15000	1125

Globe Valves, Tees and Elbows

The reduction of pressure produced by globe valves is the same as that caused by the following additional lengths of straight pipe, as calculated by the formula:

$$\text{Additional length of pipe} = \frac{114 \times \text{diameter of pipe}}{1 + (3.6 \div \text{diameter})}$$

Diameter of pipe, inches	1	1 $\frac{1}{2}$	2	2 $\frac{1}{2}$	3	3 $\frac{1}{2}$	4	5	6
Additional length, feet	2	4	7	10	13	16	20	28	36
Diameter of pipe, inches	7	8	10	12	15	18	20	22	24
Additional length, feet	44	53	70	88	115	143	162	181	200
The reduction of pressure produced by elbows and tees is equal to two-thirds of that caused by globe valves. The following are the additional lengths of straight pipe to be taken into account for elbows and tees. For globe valves multiply by $\frac{2}{3}$:									
Diameter of pipe, inches	1	1 $\frac{1}{2}$	2	2 $\frac{1}{2}$	3	3 $\frac{1}{2}$	4	5	6
Additional length, feet	2	3	5	7	9	11	13	19	24
Diameter of pipe, inches	7	8	10	12	15	18	20	22	24
Additional length, feet	30	35	47	59	77	96	108	120	134

These additional lengths of pipe for globe valves, elbows and tees must be added in each case to the actual length of straight pipe. Thus a 6-inch pipe, 500 feet long, with 1 globe valve, 2 elbows and 3 tees, would be equivalent to a straight pipe 500 + 36 + (2 \times 24) + (3 \times 24) = 656 feet long.

Electrical Data

1. A volt is the pressure which forces the electric current through the resistance of a circuit and is the unit of electro-motive force.
2. An ampere is the intensity of this electric current that flows through the circuit and is the unit of current.
3. The Watt is the work done in a circuit, with a current of one ampere flowing at a pressure of one volt, and is the unit of electrical energy.
4. A kilowatt is 1,000 watts, and is used as the unit of basis of charge for light and power, to avoid the use of a large number of figures, as when expressed in watts. Electrical energy is sold by the kilowatt hour or the use of one kilowatt for one hour.
5. A H. P. is a mechanical term, and is the energy required to raise 33,000 pounds one foot in one minute. Expressed in electrical terms it is equal to 746 watts or approximately three-fourths of a kilowatt. Electric energy is usually measured in kilowatts (k.w.).

Voltage in electricity is similar to pressure in water or steam power and amperage corresponds to volume.

$$\begin{aligned}\text{Volts} \times \text{Amperes} &= \text{Watts} \\ 1000 \text{ Watts} &= 1 \text{ K. W.} = 1.34 \text{ H. P. (horse power)} \\ 746 \text{ Watts} &= 1 \text{ H. P.} = .746 \text{ K. W.}\end{aligned}$$

Carbon lamps take from 3 to 5 watts per candle power (c.p.). Tungsten lamps take 1.23 watts per c.p., give a whiter, softer light, and are less affected by fluctuation in voltage.

While the Tungsten or Mazda lamp for higher voltages requires careful handling, the 32-volt Tungsten lamp is no more fragile than the ordinary carbon lamp, and can be had in the following sizes:

8 c.p.	= 10 watts or	.313 amperes at 32 volts
12 c.p.	= 15 watts or	.469 amperes at 32 volts.
16 c.p.	= 20 watts or	.625 amperes at 32 volts.
20 c.p.	= 25 watts or	.781 amperes at 32 volts.
32 c.p.	= 40 watts or	1.25 amperes at 32 volts.

A 32-volt Mazda lamp takes practically the same amperes as a 110-volt carbon lamp. If the current is to be transmitted more than 300 feet a higher voltage is desirable to avoid excessive drop in voltage at the end of the line.

48	400 to 425	32 to 34			

Horse-Power of Belting

A simple rule for ascertaining transmitting power of belting, without first computing speed per minute that it travels, is as follows: Multiply diameter of pulley in inches by its number of revolutions per minute, and this product by width of the belt in inches; divide this product by 3,300 for single belting, or by 2,100 for double belting, and the quotient will be the amount of horse-power that can be safely transmitted.

For Single Leather, Four Ply Rubber and Four Ply Cotton Belting, Belts not Overloaded

1 inch wide, 800 feet per minute = 1 Horse-power

Speed in feet per minute	WIDTH OF BELT IN INCHES											
	2 H. P.	3 H. P.	4 H. P.	5 H. P.	6 H. P.	8 H. P.	10 H. P.	12 H. P.	14 H. P.	16 H. P.	18 H. P.	20 H. P.
400	1	1½	2	2½	3	4	5	6	7	8	9	10
600	1½	2¼	3	3¾	4½	6	7½	9	10½	12	13¾	15
800	2½	3	4	5	6	8	10	12	14	16	18	20
1000	2	3¾	5	6¼	7½	10	12½	15	17½	20	22½	25
1200	3	4½	6	7½	9	12	15	18	21	24	27	30
1500	3¾	5¼	7½	9½	11½	15	18¾	22½	26½	30	33¾	37½
1800	4½	6¾	9	11¼	13½	18	22½	27	31½	36	40½	45
2000	5	7½	10	12½	15	20	25	30	35	40	45	50
2400	6	9	12	15	18	24	30	36	42	48	54	60
2800	7	10½	14	17½	21	28	35	42	49	56	63	70
3000	7½	11¼	15	18¾	22½	30	37½	45	52½	60	67½	75
3500	8¾	13	17½	22	26	35	44	52½	61	70	79	88
4000	10	15	20	25	30	40	50	60	70	80	90	100
4500	11¼	17	22½	28	34	45	57	69	78	90	102	114
5000	12½	19	25	31	37½	50	62½	75	87½	100	112	125

Double leather, six-ply rubber or six-ply cotton belting will transmit 50 to 75 per cent more power than is shown in this table. (One-inch wide, 550 feet per minute = one horse-power).

Rules for Determining Diameter and Speed of Rope Sheaves, Pulleys or Gears

The driving pulley is called the Driver, and the driven pulley the Driven.

If the number of teeth in gears are used instead of diameter, in these calculations, number of teeth must be substituted wherever diameter occurs.

To determine the diameter of Driver, the diameter of the Driven and its revolutions, and also the revolutions of Driver being given:

$$\frac{\text{Diameter of Driven} \times \text{revolutions of Driven}}{\text{Revolutions of Driver}} = \text{Diam. of Driver}$$

To determine the diameter of Driven, the revolutions of the Driven, and diameter and revolutions of the Driver being given:

$$\frac{\text{Diameter of Driver} \times \text{revolutions of Driver}}{\text{Revolutions of Driven}} = \text{Diam. of Driven.}$$

To determine the revolutions of the Driver, the diameter and revolutions of the Driven, and diameter of the Driver being given:

$$\frac{\text{Diameter of Driven} \times \text{revolutions of Driven}}{\text{Diameter of Driver}} = \text{Rev. of Driver}$$

To determine the revolutions of the Driven, the diameter and revolutions of the Driver, and diameter of the Driven being given:

$$\frac{\text{Diameter of Driver} \times \text{revolutions of Driver}}{\text{Diameter of Driven}} = \text{Rev. of Driven}$$

NOTE—Rope sheaves should be at least 60 diameters of the rope, never less than 40, as the durability of the rope depends entirely upon this factor.

The diameter of pulleys should be as large as can be admitted, provided they will not produce a belt travel greater than 5,000 feet per minute. About 4,000 feet, and low tension is good practice.

Rules for Horse-Power of Gearing

$$\frac{\text{Face in inches} \times \text{square of thickness of Tooth at pitch line in inches} \times \text{velocity}}{\text{Length of Tooth from point to root in inches} \times 53}$$

Equals horse-power at safety of 8; ultimate tensile strength, 30,000 pounds per square inch. Velocity to be in feet per minute at pitch line.

For bevels, thickness, length and velocity to be taken at center of face. For mortise wheels and pinions use thickness of pinion tooth. If greater margin of safety is desired, multiply above result by 8 and divide by factor of safety desired; 2,200 feet per minute at pitch line for iron gearing, and 3,000 feet for wood and iron, are excessive velocities, and should be avoided, if possible.

Horse-Power to Drive Conveyors

The capacity of conveyor being generally given in bushels per hour, find the weight of the material to be carried by multiplying the number of bushels by the weight per bushel. Divide by 60 to find the weight to be carried per minute. Multiply the result by the length of the conveyor in feet, divide the product by 33,000, and divide by 3. The result will be the horse-power required.

Capacities of Troughed Conveyor Belts

In Cubic Feet of Material Delivered per Hour at a Speed of 100 Feet per Minute

The capacity of such conveying belts is in direct proportion to the speed. The speed at which a belt can be run depends upon the character of the material to be carried, and upon the special conditions of each case; 750 feet per minute is not an extraordinary speed for grain-carrying belts.

Width of Belt, inches.....	12	14	16	18	20	22	24	26	28	30	32	34	36
Capacity in cubic feet.....	187	255	333	413	521	630	750	880	1020	1170	1333	1505	1687
Capacity in bushels.....	150	200	265	332	418	506	602	707	820	940	1117	1210	1355

Horse-Power to Drive Elevators

The capacity of elevators being generally given in bushels per hour, find the number of pounds elevated per hour by multiplying the number of bushels by the weight of each bushel; dividing this by 60 will give the number of pounds lifted per minute.

Multiply the number of pounds lifted per minute by the height of the elevator, and divide the product by 33,000. The result will give the theoretical horse-power necessary, to which should be added 50 per cent for friction.

Capacity of Elevators

Size of Bucket	Distance Apart, Center to Center, Inches	Diameter of Head Pulley, Inches	Speed of Head Shaft, Revolutions per Minute	Speed of Belt, Feet per Minute	Capacity, Bushels per Hour
2 x2	10	16	48	200	28
2½x2½	10	16	48	200	50
3 x3	10	18	45	215	88
3½x3	10	18	45	215	98
4 x3	12	20	42	220	140
4½x3½	12	20	42	220	198
5 x4	12	20	42	220	264
5½x4	12	24	40	250	350
6 x4	12	24	40	250	430
7 x4½	12	24	40	250	614
8 x5	12	30	38	300	974
9 x5½	16	30	38	300	1,216
10 x5½	16	36	36	340	1,637
11 x6	16	40	34	360	2,309
12 x6½	16	40	34	360	2,820
14 x6½	16	48	32	400	3,134
16 x6½	16	48	32	400	4,450
18 x7	16	54	31	440	6,393
20 x7	16	60	30	470	7,450

The above table of capacity applies only to buckets with round bottom and corners, which, owing to their peculiar shape, take full load and discharge perfectly.

In figuring capacity of ordinary buckets a deduction of about 10 per cent should be made.

The size of pulleys and speed of belts given above are intended only to cover the average practice as to these items. With larger pulleys a greater belt speed may be used with satisfactory discharge of the buckets and with increased capacity.

Sizing and Cutting of Gear Wheels

Let D = Outside Diameter
 D' = Pitch Diameter.
 D'' = Working Depth.
 f = Clearance.

$D'' + f$ = Whole Depth.
 a = Addendum.
 $a + f$ = Root.
 t = Thickness.

P = Diametral Pitch.
 P' = Circular Pitch.
 N = Number of Teeth.

Formulae for Diametral Pitch

$$D = \begin{cases} \frac{N+2}{P} \text{ or } D + \frac{2}{P} \\ \frac{(N+2)D'}{N} \text{ or } (N+2)s \end{cases}$$

$$D' = \begin{cases} \frac{N}{P} \text{ or } \frac{D}{N+2} \\ \text{or } D - \frac{2}{P} \text{ or } sN \end{cases}$$

$$P = \frac{3.1416}{D'} \text{ or } \frac{N}{D'} \text{ or } \frac{N+2}{D}$$

$$N = D'P \text{ or } DP - 2$$

$$t = \frac{1.5708}{P}$$

$$s = \frac{1}{P} \text{ or } \frac{D'}{N}$$

$$a + f = \frac{1.57}{P}$$

$$f = \frac{157}{P} \text{ or } \frac{t}{10}$$

$$D'' = \frac{2}{P}$$

$$D'' + f = \frac{2.157}{P}$$

Diameter, when applied to gears, is always understood to mean the pitch diameter.

Diametral Pitch is the number of teeth to each inch of the pitch diameter.

Example: If a gear has 40 teeth and the pitch diameter is 4 inches, there are 10 teeth to each inch of the pitch diameter and the diametral pitch is 10, or, in other words, the gear is 10 diametral pitch.

Diametral Pitch required, number of teeth and outside diameter given. Add 2 to the number of teeth and divide by the outside diameter.

Example: If the number of teeth is 40, the diameter of the blank is $10\frac{1}{4}$ inches, add 2 to the number of teeth, making 42, and divide by $10\frac{1}{4}$ the quotient, 4, the diametral pitch.

Circular Pitch is the distance from the center of one tooth to the center of the next, measured along the pitch line.

Example: If the distance from the center of one tooth to the center of the next tooth, measured along the pitch circle, is $\frac{1}{2}$ inch, the gear is $\frac{1}{2}$ inch circular pitch.

Circular Pitch required, diametral pitch given. Divide 3.1416 by the diametral pitch.

Example: If the diametral pitch is 4, divide 3.1416 by 4 and the quotient, .7854 inch, is the circular pitch.

Number of Teeth required, pitch diameter and diametral pitch given. Multiply the pitch diameter by the diametral pitch.

Example: If the diameter of the pitch circle is 10 inches the diametral pitch is 4, multiply 10 by 4 and the product, 40, will be the number of teeth in the gear.

Distance Between Centers of two gears required. Add the number of teeth together and divide one-half the sum by the diametral pitch.

Example: If two gears have 50 and 30 teeth, respectively, and are 5 pitch, add 50 and 30, making 80, divide by 2 and then divide the quotient, 40, by the diametral pitch, 5, and the result 8 inches, is the center distance.

Formulae for Circular Pitch

$$D = \begin{cases} \frac{.3183P'}{(N+2)} \\ \text{or } \frac{s(N+2)}{D'} + .6336P' \end{cases}$$

$$D' = \begin{cases} \frac{.3183NP}{N+2} \\ \text{or } \frac{N}{N+2} \text{ or } D - .6366P' \end{cases}$$

$$P' = \begin{cases} \frac{3.1416}{P} \text{ or } \frac{D'}{.3183} \\ \text{or } \frac{D}{.3183N+2} \end{cases}$$

$$N = \frac{3.1416D'}{P'}$$

$$t = \frac{P'}{2}$$

$$s = .3183 P'$$

$$a + f = .3683 P'$$

$$f = .05P \text{ or } \frac{t}{10}$$

$$D'' = .6366 P'$$

$$D'' + f = .6866 P'$$

Diametral Pitch required, circular pitch given. Divide 3.1416 by the circular pitch.

Example: If the circular pitch is 2 inches, divide 3.1416 by 2 and the quotient, 1.5708, is the diametral pitch.

Number of Teeth required, outside diameter and diametral pitch given. Multiply the outside diameter by the diametral pitch and subtract 2.

Example: If the whole diameter is $10\frac{1}{4}$ and the diametral pitch is 4, multiply $10\frac{1}{4}$ by 4 and the product, 42 less 2, or 40, is the number of teeth.

Pitch Diameter required, number of teeth and diametral pitch given. Divide the number of teeth by the diametral pitch.

Example: If the number of teeth is 40 and the diametral pitch is 4, divide 40 by 4 and the quotient, 10, is the pitch diameter.

Outside Diameter or size of gear required, number of teeth and diametral pitch given. Add 2 to the number of teeth and divide by the diametral pitch.

Example: If the number of teeth is 40 and the diametral pitch is 4, add 2 to the 40, making 42, and divide by 4; the quotient, $10\frac{1}{2}$, is the whole diameter of the gear or blank.

Thickness of Tooth at Pitch Line required. Divide the circular pitch by 2, or 1.57, by the diametral pitch.

Example: If the circular pitch is 1.047 inch, or the diametral pitch is 3, divide 1.047 by 2, or 1.57 by 3, and the quotient, .523 inch, is the thickness of tooth.

Whole Depth of Tooth required. Divide 2.157 by the diametral pitch.

Example: If the diametral pitch of a gear is 6, the whole depth is 2.157 divided by 6, which equals .3595.

Whole Depth of Tooth is about 11-16 or exactly .6866 of the circular pitch.

Example: If the circular pitch is 2 inches, the whole depth of tooth is about 11-16 or 2 inches or $1\frac{1}{2}$ inches nearly.

Gear Diameters

Table for finding the diameter of a gear when the pitch is given, or the pitch of a gear when the diameter is given, that shall contain from 10 to 250 teeth, and any pitch required.

Rule:—Multiply X in the table by the pitch given and the product will be the pitch diameter of the gear required. Or, divide the pitch diameter of the gear by X in the table and the quotient will be the pitch of the gear required.

Teeth	X	Teeth	X	Teeth	X	Teeth	X	Teeth	X	Teeth	X
10	3,236	51	16,244	92	29,290	133	42,338	174	55,388	215	68,430

Spur Gear Selection Chart

For Size or H. P. By E. E. Landahl From American Machinist

The accompanying logarithmic chart is for readily determining the size of a gear when the horsepower to be transmitted and the shaft speed are given or, conversely, the horsepower that can be transmitted by a given gear running at a known speed. The table is based on the Lewis formula as given in Kent's "Handbook," using stresses for S as there tabulated for cut cast-iron teeth, one-half of these values for plain cast-iron teeth, one and one-fourth times these values for plain cast-steel teeth and two and one-half times for cut cast-steel gears. The table is based on a gear face three times the circular pitch. For other faces divide the determined horsepower by the face on which the table is based and multiply by the one to be used.

In using the table there are certain further factors of vital importance that must be carefully considered. One of these is the peripheral speed. Authorities differ as to the limiting speeds for safe usage, but good practice has determined 700 feet per minute for rough teeth and 1,500 feet per minute for cut teeth as the limits to be used. Another point that should be borne in mind is that the horsepower of the pinion should be traced out when the same material is used in both of the mating wheels.

As an example of the use of the chart, let us trace out a problem. Assume that we desire to determine the proper size for a gear to transmit 25 horsepower, the shaft speed being 45 revolutions per minute. This problem is traced out with a heavy line on the chart. The procedure is as follows:

Find the horizontal line corresponding the 45 r.p.m. and trace upward until this line intersects an imaginry diagonal corresponding to 25 h.p. between the lines given for 20 and 30 h.p. From this point trace to the right or left of the table, depending on the kind of gear tooth desired. Assuming a plain cast-iron tooth, the righthand direction is taken. It will be noticed that the horizontal path intersects the vertical line representing 15 teeth midway between the curved diagonals for $2\frac{1}{2}$ in. and $2\frac{3}{4}$ in. This means that $2\frac{3}{4}$ -inch circular pitch should be used for a 15-tooth pinion. For a 17-tooth pinion a $2\frac{1}{2}$ -inch pitch is satisfactory. Gears of other types can be similarly determined from the tables above the r.p.m. section, notice being made that circular pitch is plotted for cast teeth and diametral pitch for cut teeth. For example:

1. If we wish to use cast-steel cast-tooth pinion, 17T should be $1\frac{3}{4}$ -inch pitch; 16T and below should be 2-inch pitch.
2. In the cast-steel cut-tooth table we could use 19T— $2\frac{1}{4}$ diametral pitch; or 15T to 18T inclusive, $2\frac{1}{4}$ pitch.
3. Passing on up to the cast-iron cut-tooth, gears, we could use 20T— $1\frac{3}{4}$ diametral pitch or $1\frac{1}{2}$ pitch with any less number of teeth.

For finding the horsepower for a certain gear at a given speed simply reverse this operation.

Splicing Manila Transmission Ropes

The successive operations for making a common or English splice in a $1\frac{3}{4}$ -inch 4 strand rope is as follows:

1. Tie a piece of twine, 9 and 10, around the rope to be spliced, about six feet from each end. Then unlay the strands of each end back to the twine.

2. Put the ropes together and twist each corresponding pair of strands loosely, to keep them from being tangled, as shown at (a).

3. The twine 10 is now cut, and the strand 8 unlayed and strand 7 carefully laid in its place for a distance of four and a half feet from the junction.

4. The strand 6 is next unlayed about one and a half feet and strand 5 laid in its place.

5. The ends of the cores are now cut off so they just meet.

6. Unlay strand 1 four and a half feet, laying strand 2 in its place.

7. Unlay strand 3 one and a half feet, laying in strand 4.

8. Cut all the strands off to a length of about twenty inches, for convenience in manipulation. The rope now assumes the form shown in (b), with the meeting points of the strands three feet apart.

Each pair of strands is now successively subjected to the following operations:

9. From the point of meeting of the strand 8 and 7 unlay each one three turns; split both the strand 8 and the strand 7 in halves, as far back as they are now unlayed, and the end of each half strand "whipped" with a small piece of twine.

10. The half of the strand 7 is now laid in three turns, and the half of 8 also laid in three turns. The half strands now meet and are tied in a simple knot 11, (c), making the rope at this point its original size.

11. The rope is now opened with a marlinspike, and the half strand of 7 worked around the half strand of 8 by passing the end of the half strand through the rope, as shown, drawn taut, and again worked around this half strand until it reaches the half strand 13 that was not laid in. This half strand 13 is now split, and the half strand 7 drawn through the opening thus made, and then tucked under the two adjacent strands, as shown in (d).

12. The other half of the strand 8 is now wound around the other half strand 7 in the same way. After each pair of strands has been treated in this manner, the ends are cut off at 12, leaving them about four inches long. After a few days wear they will draw into the body of the rope or wear off, so that the locality of the splice can scarcely be detected.

The chief trouble in the past, with rope transmission, has been in defective splicing. We have a corps of expert splicers to send out at any time.

From Channon's "A Treatise on Rope Transmission," Copyrighted 1896.

For greatest Strength, Safety and Economy—Specify Ajax Manila Transmission Rope.

Table of Emery Wheel Speeds

The following table designates number of revolutions per minute for specified diameters of wheels, to cause them to run at the respective periphery rates of 4,000, 5,000 and 6,000 feet per minute.

The medium of 5,000 feet is usually employed in ordinary work, but in special cases it is sometimes desirable to run them at a lower or higher rate according to requirements.

The stress on the wheel at 4,000 feet periphery speed per minute, is 48 pounds per square inch; at 5,000 feet, 75 pounds; at 6,000 feet, 108 pounds.

Diameter Wheel in Inches	Rev. per Minute for Surface Speed of 4,000 feet	Rev. per Minute for Surface Speed of 5,000 feet	Rev. per Minute for Surface Speed of 6,000 feet
1	15,279	19,099	22,918

Grades of Emery

(Kent's Mechanical Engineers' Pocket Book,
Eighth Edition)

The numbers representing the grades of emery run from 8 to 120 and the degree of smoothness of surface they leave may be compared to that left by files, as follows:

8 and 100	represent the cut of	a wood rasp.
16 "	20 "	" a coarse-rough file.
24 "	30 "	" an ordinary rough file
36 "	40 "	" a bastard file.
46 "	60 "	" a second-cut file.
70 "	80 "	" a smooth file.
90 "	100 "	" a superfine file.
120 F "	FF "	" a dead-smooth file.

Table of Speeds for Circular Saws

Size of Saw	Revs. per Minute	Size of Saw	Revs. per Minute	Size of Saw	Revs. per Minute
8	4,500	30	1,200	52	700
10	3,600	32	1,125	54	675
12	3,000	34	1,058	56	650
14	2,585	36	1,000	58	625
16	2,222	38	950	60	600
18	2,000	40	900	62	575
20	1,800	42	870	64	550
22	1,636	44	840	66	545
24	1,500	46	800	68	529
26	1,384	48	750	70	514
28	1,285	50	725	72	500

The Power Required to Saw Some Kinds of Timber

with 7 gauge saws, over and above what is necessary to run the saw and the carriage while not cutting, is approximately as follows:

Basswood, $\frac{1}{2}$ to $\frac{1}{2}$ H. P. for each 1 inch width of cut or 1 inch feed.

Pine, white, $\frac{1}{2}$ to $\frac{3}{8}$ H. P. for each 1 inch width of cut or 1 inch feed.

Pine, yellow, $\frac{3}{4}$ to 1 H. P. for each 1 inch width of cut or 1 inch feed.

Spruce, 3-5 to 4-5 H. P. for each 1 inch width of cut or 1 inch feed.

Hardwoods, 1 to 2+ H. P. for each 1 inch width of cut or 1 inch feed.

Thus it will be seen that the work of cutting and the increased resistance to the feed, in sawing white pine, a 12-inch cut on 2-inch feed would be about,

$$\frac{1}{2} \times 12 \times 2 = 12 \text{ H. P. or}$$

$$W \times 12 \times 2 = 16 \text{ H. P.}$$

Eight-gauge saws will do the work with a little less power.

Areas of Circles

[illegible]

To determine the Area of a Circle multiply the square of its diameter by .7854. Example, a 12-inch circle; $12 \times 12 = 144 \times .7854 = 113.976$ inches, the area of a 12-inch circle.

Circumferences of Circles

[illegible]

To determine the circumference of a circle, multiply the diameter by 3.1416.

U. S. Measures and Weights

Dry Measure—U. S.

2 pints = 1 quart. 8 quarts = 1 peck. 4 pecks = 1 bushel.
The standard U. S. bushel is in cylinder form, 18½ inches diameter and 8 inches deep, and contains 2150.42 cubic inches.
A struck bushel = 2150.42 cubic inches, or 1.2445 cubic feet.
A heaped bushel = 1½ struck bushels.

Shipping Measure

100 cubic feet = 1 register ton.
1 U. S. shipping ton.
40 cubic feet = 31.16 Imperial bushels.
32.143 U. S. bushels.
1 British shipping ton.
42 cubic feet = 32.719 Imperial bushels.
33.75 U. S. bushels.

Measures of Weight.—Avoirdupois or Commercial Weight

16 drachms, or 437.5 grains = 1 ounce, oz.
16 ounces, or 7,000 grains = 1 pound, lb.
28 pounds = 1 quarter, qr.
4 quarters = 1 hundred-weight, cwt. = 112 lbs.
20 hundred-weight = 1 ton of 2240 pounds, or long ton.
2000 pounds = 1 net, or short ton.
2204.6 pounds = 1 metric ton.
1 stone = 14 pounds. 1 quintal = 100 pounds.

Troy Weight

24 grains = 1 pennyweight, dwt.
20 pennyweights = 1 ounce, oz. = 480 grains.
12 ounces = 1 pound, lb. = 5760 grains.

Apothecaries' Weight

20 grains = 1 scruple.
3 scruples = 1 drachm = 60 grains.
8 drachms = 1 ounce = 480 grains.
12 ounces = 1 pound = 5760 grains.

Circular Measure

60" = 1 minute'.
60 minutes' = 1 degree'.
90 degrees = 1 quadrant.
360 degrees = 1 circumference.

Time

60 seconds = 1 minute.
60 minutes = 1 hour.
24 hours = 1 day.
7 days = 1 week.
365 days, 5 hours, 48 minutes, 48 seconds = 1 year.

Board Measure

The number of feet, board measure (B. M.) = length in feet x breadth in feet x thickness in inches.

1 U. S. gallon = 8.33 pounds. 1 English gallon = 10 pounds.
1 cubic foot of ice = 37.2 pounds.
1 ton of water = 35.90 cubic feet.
1 cubic foot of water at 39.1°F = 62.425 pounds.
1 cubic inch of water at 39.1°F = .036 pounds.
1 pound of water = 27.72 cubic inches.

Long Measure—Measures of Length

12 inches = 1 foot.
3 feet, or 36 inches = 1 yard.
3½ yards, or 10½ feet = 1 rod, pole or perch.
40 rods, or 220 yards = 1 furlong.
8 furlongs, or 320 rods, or 1,760 yards or 5,280 feet = 1 mile.
3 miles = 1 league.

Additional Measures of Length

1,000 mills = 1 inch. 4 inches = 1 hand. 9 inches = 1 span.
2½ feet = 1 military pace. 2 yards = 1 fathom.

Square Measure—Measures of Surface

144 square inches, or 183.35 circular inches = 1 square foot.
9 square feet = 1 square yard.
30¼ square yards, or 272¼ square feet = 1 square rod, pole or perch.
160 square rods = 1 acre.
640 acres = 1 square mile.
An acre equals a square whose side is 208.71 feet.
A circular inch is the area of a circle 1 inch in diameter = 0.785398 square inches.
1 square inch = 1.2732 circular inches.
A circular mil is the area of a circle 1 mil or .001 in diameter.
The mil is used in electrical calculations.

Solid or Cubic Measure—Measures of Volume

1728 cubic inches = 1 cubic foot.
27 cubic feet = 1 cubic yard.
1 cord of wood = a pile, 4x4x8 feet = 128 cubic feet.
1 perch of masonry = 16½x1½x1 foot = 24¼ cubic feet.

Liquid Measure

4 gills = 1 pint.
2 pints = 1 quart.
4 quarts = 1 gallon U. S. 231 cubic inches.
English 277.274 cubic inches.
31½ gallons = 1 barrel.
42 gallons = 1 tierce.
2 barrels or 63 gallons = 1 hogshead.
84 gallons or 2 tierces = 1 puncheon.
2 hogsheads or 126 gallons = 1 pipe or butt.
2 pipes or 3 puncheons = 1 tun.
7.4805 U. S. gallons = 1 cubic foot.
1 British Imperial gallon = 1.20032 U. S. gallons.

Apothecaries' Fluid Measure

60 minims = 1 fluid drachm.
8 drachms, or 437½ grains, or 1.732 cubic inches = 1 fluid ounce.
Water is at its greatest density at 39.2°F.
Sea water is 1.6 to 1.9 heavier than fresh water.
1 cubic inch of water makes approximately 1 cubic foot of steam at atmospheric pressure.
27222 cubic feet of steam at atmospheric pressure weighs 1 pound.

Proportion of Nut Heads, Nuts and Washers

Diameter of bolt = 1.
Diameter of the head and nut, square or hexagon = 1½ from side to side.

Diameter of head and nut, hexagon = 2 over the angles.
Thickness of head = ¾ of diameter of bolt.
Thickness of nut = 1½ of diameter of bolt.
Washers should equal half the thickness of the head, and have twice the area.

Approximately—The weight of a hexagon head and square nut together will equal a rod of iron in length five times the diameter of the bolt.

For square heads and nuts, six times the diameter.
And for rose heads and square nuts, four times the diameter.

Rivets

Diameter of rivets for plates less than ½ inch thick = twice thickness of the plate.

Diameter of rivets for plates ½ inch thick and upwards = once and a half the thickness of the plate.

Length of rivet measured before clinching = the thickness of the plate + 2½ times the diameter of the rivet.

Shrinkage of Castings

In locomotive cylinders is ¼ inch in a foot.
Pipes is ¼ inch in a foot.
Girders, beams, etc., is ¼ inch in 15 inches.
Engine beams, connecting rods, etc., is ¼ inch in 16 inches.
Large cylinders, say 70 inch diameter, 10 foot stroke, the contraction of diameter is ¾ inch at top, ½ inch at bottom, and ¼ inch in 16 inches in length.
Thin brass is ¼ inch in 9 inches.
Thick brass is ¼ inch in 10 inches.
Zinc is ¼ inch in a foot.
Lead is ¼ inch in a foot.
Copper is ¼ inch in a foot.
Bismuth is ¼ inch in a foot.
Tin is ¼ inch in a foot.

Metric System and Equivalents

The Metric System is based on the Meter which was designed to be one ten-millionth ($\frac{1}{10,000,000}$) part of the earth's meridian, passing through Dunkirk and Formentera. Later investigations, however, have shown that the Meter exceeds one ten-millionth part by almost one part in 6400. The value of the Meter, as authorized by the U. S. Government, is 39.37 inches. The Metric system was legalized by the U. S. Government in 1866.

The three principal units are the meter, the unit of length, the liter, the unit of capacity, and the gram, the unit of weight. Multiples of these are obtained by prefixing the Greek words: deka (10), hekto (100), and kilo (1000). Divisions are obtained by prefixing the Latin words: deci ($\frac{1}{10}$), centi ($\frac{1}{100}$), and milli ($\frac{1}{1000}$). Abbreviations of the multiples begin with a capital letter, and of the divisions with a small letter, as in the following tables:

Measures of Length

10 millimeters (mm.)	= 1 centimeter (cm.)	= .3937 in.
10 decimeters	= 1 meter (m.)	= 3.28083 ft. = 39.37 in.
10 meters	= 1 dekameter (Dm.)	
10 dekameters	= 1 hektometer (Hm.)	
10 hektometers	= 1 kilometer (Km.)	= 0.62137 mile
1 foot	= .3048 meter	
1 inch	= .0254 meters	

Measures of Surface (not Land)

100 sq. millimeters	= 1 sq. centimeter (cm. ²)	= 0.155 sq. in.
100 sq. centimeters	= 1 sq. decimeter (dm. ²)	
100 sq. decimeters	= 1 sq. meter (m. ²)	= 10.764 sq. ft.
1 sq. yard	= .836 sq. meter	
1 sq. foot	= .0929 sq. meter	
1 sq. inch	= .00645 sq. millimeters	

Measures of Volume

1000 cubic millimeters (mm. ³)	= 1 cubic centimeter (cm. ³)	= .061 cu. in.
1000 cubic centimeters	= 1 cubic decimeter (dm. ³)	= 1 liter = 61.023 cu. in.
1000 cubic decimeters	= 1 cubic meter (m. ³)	= 35.314 cu. ft. = 264.2 gallons.
1 cubic yard	= .7645 cubic meter	
1 cubic foot	= .02832 cubic meter	
1 cubic inch	= .016387 cubic centimeters	

Measures of Capacity

10 millimeters (ml.)	= 1 centiliter (cl.)	
10 centiliters	= 1 deciliter (dl.)	
10 deciliters	= 1 liter (l.)	= 1.0567 qts. (U. S.) = 61.023 cu. in.
10 liters	= 1 dekaliter (Dl.)	
10 dekaliters	= 1 hektoliter (Hl.)	
10 hektoliters	= 1 kiloliter (Kl.)	
1 gallon (U. S.)	= 3.785 liters	
1 gallon (British)	= 4.543 liters	

Measures of Weight

10 milligrams (Mg.)	= 1 centigram (cg.)	
10 centigrams	= 1 decigram (dg.)	
10 decigrams	= 1 gram (g.)	= 15.432 grains.
10 grams	= 1 dekagram (Dg.)	
10 dekagrams	= 1 hektogram (Hg.)	
10 hektograms	= 1 kilogram (Kg.)	= 2.2046 pounds.
1000 kilograms	= 1 ton (T.)	= .9842 ton of 2,240 pounds

Note.—The gram is the weight of one cubic centimeter of pure distilled water at a temperature of 39.2°F.; the kilogram is the weight of 1 liter of water; the ton is the weight of 1 cubic meter of water.

1 grain	= .0648 gram	1 ounce (Avo.) = 28.35 grams.
1 pound	= 453.6 kilograms	1 ton of 2240 pounds = 1.016 metric tons.

Metric Units

The most common of these units, with their abbreviations, are as follows:

meter (m.)	1 inch (in.) = 2.54 cm.	1 m.	= .3937 in.
kilometer (km.)	1 foot (ft.) = 30.48 cm.	1 cm.	= .3937 in.
centimeter (cm.)	1 sq. in. = 6.45 sq. cm.	1 sq. cm.	= .1550 sq. in.
millimeter (mm.)	1 sq. ft. = .0929 sq. m.	1 sq. m.	= 10.06 sq. ft.
liter (l.)	1 cu. ft. = 28.317 cc.	1 cu. m.	= 35.32 cu. ft.
cubic centimeter (cc.)	1 qt. = .9463 l.	1 l.	= 1.057 qt.
gram (g.)	1 oz. av. = 28.35 g.	1 g.	= .0353 oz.
kilogram (kg.)	1 lb. av. = 4.537 kg.	1 kg.	= 2.204 lb.
milligram (mg.)

Miscellaneous

1 kilogram per meter	= .6720 pounds per foot.
1 gram per square millimeter	= 1.422 pounds per square inch.
1 kilogram per square meter	= 0.2084 per square foot.
1 kilogram per cubic meter	= .0624 per cubic foot.
1 degree centigrade	= 1.8 degrees Fahrenheit.
1 pound per foot	= 1.488 kilograms per meter.
1 pound per square foot	= 4.882 kilograms per square meter.
1 pound per cubic foot	= 16.02 kilograms per cubic meter.
1 degree Fahrenheit	= .5556 degrees centigrade.
1 Calorie (French Thermal Unit)	= 3.968 B. T. U. (British Thermal Unit).
1 Horse Power	= 33,000 foot pounds per minute.
	= 746 Watts.
1 Watt (Unit of)	= .00134 Horse Power.
Electrical Power	= 1.474 foot pounds per minute.
	= 1000 Watts.
1 Kilowatt	= 1.34 Horsepower.
	= 44240 foot pounds per minute.

Metric Conversion Table

Millimetres $\times .03937$ = inches.
 Millimetres $\div 25.4$ = inches.
 Centimetres $\times .3937$ = inches.
 Centimetres $\div 2.54$ = inches.
 Metres $\times 39.37$ = inches.
 Metres $\times 3.281$ = feet.
 Metres $\times 1.094$ = yards.
 Kilometres $\times 621$ = miles.
 Kilometres $\div 1.6093$ = miles.
 Kilometres $\times 3280.8693$ = feet.
 Sq. Millimetres $\times .00155$ = sq. in.
 Sq. Millimetres $\div 645.16$ = sq. in.
 Sq. Centimetres $\times .155$ = sq. in.
 Sq. Centimetres $\div 6.451$ = sq. in.
 Sq. Metres $\times 10.764$ = sq. ft.
 Sq. Kilometres $\times 247.1$ = acres.
 Hectare $\times 2.471$ = acres.
 Cu. Centimetres $\div 16.383$ = cu. in.

Cu. Centimetres $\div 3.69$ = fluid drams.
 Cu. Centimetres $\div 29.57$ = fluid ounces.
 Cu. Metres $\times 35.315$ = cu. ft.
 Cu. Metres $\times 1.308$ = cu. yds.
 Cu. Metres $\times 264.2$ = gals. (231 cu. in.)
 Litres $\div 61.022$ = cu. in.
 Litres $\times 33.84$ = fluid ounces.
 Litres $\times 2.642$ = gals. (231 cu. in.)
 Litres $\div 3.78$ = gals. (231 cu. in.)
 Litres $\div 28.316$ = cu. ft.
 Hectolitres $\times 3.531$ = cu. ft.
 Hectolitres $\times 2.84$ = Bu. (2150.42 cu. in.)
 Hectolitres $\times 1.31$ = cu. yds.
 Hectolitres $\div 26.42$ = gals. (231 cu. in.)
 Grammes $\times 15.432$ = grains.
 Grammes $\times 981$ = dynes.
 Grammes (water) $\div 29.57$ = fluid oz.
 Grammes $\div 28.35$ = oz. avoirdupois.

Grammes per cu. cent. $\div 2.77$ = lbs. p. cu. in.
 Joule $\times 7373$ = ft. lbs.
 Kilo-grammes $\times 2.2046$ = pounds.
 Kilo-grammes $\times 35.3$ = oz. avoirdupois.
 Kilo-grammes $\div 907.2$ = tons (2000 lbs.)
 Kilo-gr. p. sq. cent. $\times 14.223$ = lbs. p. sq. in.
 Kilo-gram-metres $\times 7.233$ = ft. lbs.
 Kilo-gr. p. Metre $\times .672$ = lbs. per ft.
 Kilo-gr. p. cu. Metre $\times .062$ = lbs. p. cu. ft.
 Kilo-gr. p. Cheval $\times 2.235$ = lbs. p. H. P.
 Kilo-Watts $\times 1.34$ = Horse-power.
 Watts $\div 746$ = Horse-power.
 Watts $\times 7373$ = ft. pounds p. second.
 Calorie $\times 3.968$ = B. T. U.
 Cheval vapeur $\times 9863$ = Horse-power.
 (Centigrade $\times 1.8$) $\div 32$ = degrees Fahr.
 Franc $\times 193$ = Dollars.
 Gravity Paris = 980.94 centimetres per sec.

For Reference

Diameter of a circle $\times 3.1416$ = circumference.
 Diameter of a circle $\times .8862$ = side of an equal square.
 Diameter of a circle $\times .7071$ = side of an inscribed square.
 Square of a diameter $\times .7854$ = area of circle.
 Circumference of a circle $\times .31831$ = diameter.
 Side of a square $\times 1.128$ = diameter of equal circle.
 Square root of an area $\times 1.12837$ = diameter of equal circle.
 Square of the diameter of a sphere $\times 3.1416$ = convex surface.
 Cube of the diameter of a sphere $\times .5236$ = solidity.
 Diameter of a sphere $\times .806$ = dimensions of equal cube.
 Diameter of a sphere $\times .6667$ = length of equal cylinder.
 Square inches $\times .00695$ = square feet.
 Cubic inches $\times .00058$ = cubic feet.
 Cubic feet $\times .03704$ = cubic yards.
 Cylindrical inches $\times .0004546$ = cubic feet.
 Cylindrical feet $\times .02909$ = cubic yards.
 Cubic inches $\times .003607$ = imperial gallons.
 Cubic feet $\times .6232$ = imperial gallons.

Cylindrical inches $\times .002832$ = imperial gallons.

Cylindrical feet $\times 4.895$ = imperial gallons.

183.346 circular inches = 1 square foot.

2,200 cylindrical inches = 1 cubic foot.

Avoirdupois pounds $\times .009$ = cwt.

Avoirdupois pounds $\times .00045$ = tons.

Lineal feet $\times .00019$ = statute miles.

Lineal yards $\times .000568$ = statute miles.

To find the pressure in pounds per square inch of a column of water, multiply height of column in ft. by .434.

Doubling the diameter of a circle increases its area four times.

Area of a triangle = base multiplied by half the altitude.

Area of a sector of a circle = one-half the length of the arc multiplied by the radius of the circle.

To find the capacity (U. S. gallons) of cylindrical tanks, square the diameter expressed in inches, multiply by the length and by .0034.

Useful Information

Approximate Weight of Hose
In Pounds, per Length of 50 Feet

SIZE, INCHES.....	$\frac{1}{2}$	$\frac{3}{4}$	1	1 $\frac{1}{4}$	1 $\frac{1}{2}$	2	2 $\frac{1}{2}$	3	4
Water, 3-ply.....	13	19	24	32	38	49	70	80	115

Rule for finding the Weight of Castings or Forgings by the Weight of their Patterns THEIR PATTERNS.

Multiply the weight of the white pine pattern by 16 for cast iron; 17.1 for wrought iron; 17.3 for steel; 18 for copper; 25 for lead; 12.2 for tin; 13 for brass; 11.4 for zinc, and the product is the weight of the casting

H. Channon Company Chicago

Useful Information

Weights of Various Substances per Cubic Foot

Names of Substances.	Average Weight, lbs.	Names of Substances.	Average Weight, lbs.
Anthracite, solid, of Pennsylvania.....	93	Limestones and Marbles.....	168
" broken, loose.....	54	" loose, in irregular fragments.....	96
" moderately shaken.....	58	Mahogany, Spanish, dry.....	53
" heaped bushel, loose.....	(80)	Honduras, dry.....	35
Ash, American white, dry.....	38	Maple, dry.....	49
Asphaltum.....	87	Marbles, see Limestones.....	
Brass (copper and zinc), cast.....	504	Masonry, of granite or limestone, well dressed.....	165
Brick, best pressed.....	524	" of mortar rubble.....	154
" common hard.....	150	" of dry rubble (well cabbled).....	138
" soft, inferior.....	125	" of sandstone, well dressed.....	144
Brickwork, pressed brick.....	140	Mercury, at 32° Fahrenheit.....	849
" ordinary.....	112	Mica.....	183
Cement, hydraulic, ground, loose, American, Rose- dale.....	56	Mortar, hardened.....	103
Cement, hydraulic, ground, loose, American, Louis ville.....	50	Mud, dry, close.....	80 to 110
Cement, hydraulic, ground, loose, English, Portland.....	90	" wet, fluid, maximum.....	120
Cherry, dry.....	42	Oak, live, dry.....	59
Chestnut, dry.....	41	" white, dry.....	52
Coal, bituminous, solid.....	84	" other kinds.....	32 to 45
" broken, loose.....	49	Petroleum.....	55
" heaped bushel, loose.....	(74)	Pine, white, dry.....	25
Coke, loose, of good coal.....	27	" yellow, Northern.....	45
" heaped bushel.....	(38)	" Southern.....	45
Copper, cast.....	542	Platinum.....	1,342
" rolled.....	548	Quartz, common, pure.....	165
Earth, common loam, dry, loose.....	76	Rosin.....	69
" moderately rammed.....	95	Salt, coarse, Syracuse, N. Y.....	45
" as a soft flowing mud.....	108	" Liverpool, fine, for table use.....	49
Ebony, dry.....	76	Sand, of pure quartz, dry, loose.....	90 to 106
Elm, dry.....	35	" well shaken.....	99 to 117
Flint.....	162	" perfectly wet.....	120 to 140
Glass, common window.....	157	Sandstones, fit for building.....	151
Gneiss, common.....	168	Shales, red or black.....	162
Gold, cast, pure, or 24 carat.....	1,204	Silver.....	655
" pure hammered.....	1,217	Slate.....	175
Granite.....	170	Snow, freshly fallen.....	5 to 12
Gravel, about the same as sand, which see.....		" moistened and compacted by rain.....	15 to 10
Hemlock, dry.....	25	Spruce, dry.....	25
Hickory, dry.....	53	Steel.....	490
Hornblende, black.....	203	Sulphur.....	125
Ice.....	63.7	Sycamore, dry.....	37
Iron, cast.....	485	Tar, cast.....	62
" wrought.....	480	Tin, cast.....	459
" average.....	480	Turf or Peat, dry, unpressed.....	20 to 30
Ivory.....	114	Walnut, black, dry.....	38
Lead.....	711	Water, pure rain or distilled, at 60° Fahrenheit.....	62½
Lignum Vitæ, dry.....	83	" sea.....	64

Green timbers usually weigh from one-fifth to one-half more than dry.

Melting Point of Metals

Name.	Fahr.	Fahr.	Authority.
Platina.....	4,593		
Antimony.....	955	842	J. Lowthian Bell
Bismuth.....	487	507	
Tin (average).....	475		
Lead.....	622	620	"
Zinc.....	772	782	"
Cast Iron.....	2,010	1922-2012	White, Pouillet
Wrought Iron.....	2,910	2,192-2192	Gray, Welding Heat
Steel.....	2,370	2,733	
Copper (average).....	2,174	2,550	

General Rules for Determining the Weight of Any Piece of Wrought Iron

One cubic foot of wrought iron.....	= 480 lbs.
One square foot, one inch thick.....	= $\frac{480}{12}$ = 40 lbs.
One square inch, one foot long.....	= $\frac{480}{12 \times 12}$ = 3½ lbs.
One square inch, one yard long.....	= $\frac{480}{3 \times 12 \times 12}$ = 10 lbs.

Hence, the weight of any piece of wrought iron in pounds per yard is equal to 10 times its area in square inches

Example.—The area of a bar 3" x 1" = 3 square inches, and its weight is 30 lbs. per yard.

For round iron the weight per foot may be found by taking the diameter in quarter inches, squaring it, and dividing by 6

Example.—What is the weight of 2" round iron?
 $2'' = 8$ quarter inches. $8^2 = 64$.
 $\frac{64}{6} = 10\frac{2}{3}$ lbs per foot of 2" round.

Example.—What is the weight of ¾" round iron?
 $\frac{3}{4}'' = 3$ quarter inches. $3^2 = 9$.
 $\frac{9}{6} = 1\frac{1}{2}$ lbs. per foot of ¾" round.
